Beases of small-por only are returned as "vaccinated" or as "unvaccinated" which are so cortided by registered medical mea. When too attendant does not certify that the deceased has, or has not, been vaccinated, or which are so cortided by registered medical mea. When nor, the case is returned under the heading "no statement." evidence, at inquests, is often insufficient to enable the Coroner to certify whether a violent death be the result of accident, murder, under, a lighter, or micide. All such cases are classed under "accident.":

91700,-10.

No. 24. 1896. Vol. LVII.]

WEEK ENDING SATURDAY, JUNE 13.

Price 1 d.

General Register Office, Somerset House, June 15th, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 16.7 per 1000 of their aggregate population, which is estimated* at 10,846,948 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

	Weeks ending		Weeks ending
Towns.	May   May   June   June   23.   30.   6.   13.	Towns.	May   May   June   June   23.   30.   6.   13.

Leicester -	12.6 12.3 16.5 12.6	See a lab or de to	

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·0 in Cardiff and in Norwich, 1·1 in Oldham and in Sheffield, 1·2 in Portsmouth, 1·3 in London, 1·4 in West Ham, 1·5 in Burnley and in Sunderland, 1·6 in Gateshead, 2·0 in Bristol, 2·1 in Manchester, 2·2 in Croydon, and 2·8 in Hull; from whooping-cough, 1·0 in Cardiff, in Derby, and in Burnley, 1·2 in Salford, 1·7 in Hull, and 2·8 in Halifax; from "fever," 1.2 in Wolverhampton; and from diarrhæa, 1.2 in Salford and in Blackburn, and 1.6 in Leicester. In no case did the death-rate from scarlet fever reach 1.0 per 1000 in any of the thirty-three towns. The 69 deaths from diphtheria included 49 in London, 5 in Birmingham, 2 in Liverpool, and 2 in Leicester. No death from

small-pox was registered in any of the thirty-three towns.

In the registration district of Gloucester 8 deaths from small-pox were registered last week, all the deceased persons having been residents of Gloucester municipal

borough.

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

A 91700.—11. 650.—6/96. Wt. 124.

In London* 2482 BIRTHS and 1397 DEATHS were registered. Allowing for increase of population, the births were 151, and the deaths 55, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 17.8, 16.9, and 17.3 in the preceding three weeks, declined again last week to 16.5. During the four weeks ending on Saturday last the death-rate averaged 17.1 per 1000, being 0.6 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1397 deaths included 111 from measles, 22 from scarlet fever, 49 from

diphtheria, 58 from whooping-cough, 3 from enteric fever, one from an ill-defined form of continued fever, 20 from diarrhoa and dysentery, and not one death from small-pox, from typhus, or from cholera; thus, 264 deaths were referred to these

diseases, being 56 above the corrected average weekly number.

The deaths from measles, which had been 120, 98, and 115 in the preceding three weeks, declined again to 111 last week, but were 41 above the corrected average; 13 cases belonged to Battersea, 8 to Hackney, 8 to Wandsworth, 7 to Islington, 7 to Bethnal Green, 7 to Lambeth, 6 to Paddington, and 6 to Mile End Old Town sanitary areas. The deaths from scarlet fever, which had been 12, 19, and 13 in the preceding three weeks, rose again to 22 last week, and were 4 above the corrected average; 5 cases belonged to Greenwich, 3 to Bethnal Green, 2 to Chelsea, and 2 to Islington sanitary areas. The deaths from diphtheria, which had been 56, 40, and 52 in the preceding three weeks, fell to 49 last week, but were 16 above the corrected average; 5 cases belonged to Camberwell, 3 to Paddington, 3 to Newington, 3 to Greenwich, 3 to Lewisham, and 3 to Plumstead sanitary areas. The deaths from whooping-cough, which had been 94, 83, and 86 in the preceding three weeks, declined to 58 last week, but were 15 above the corrected average; 7 cases belonged to Lambeth, 4 to Chelsea, 4 to Islington, 4 to Mile End Old Town, and 4 to Wandsworth sanitary areas. The fatal cases of enteric fever, which had been 4, 8, and 7 in the preceding three weeks, declined to 3 last week, and were 7 below the corrected average. The deaths from diarrhea, which had been 14, 10, and 17 in the preceding three weeks, further rose to 20 last week, but were 11 below the corrected average. Of the 20 deaths directly referred to diarrhea, 14 were of children under five years of age; in addition to these, 6 deaths of children aged under five years were described as due to gastro-enteritis, and these are included among the 10 deaths at that age-period from enteritis shown in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 217, 230, and 213 in the preceding three weeks, further fell last week to 183, and were

53 below the corrected average.

The deaths attributed directly to influenza numbered 8, having been 7, 6, and 12

in the preceding three weeks.

Different forms of violence caused 73 deaths, concerning all but 3 of which inquests were held. Of these 73 deaths, 13 were cases of suicide, while the remaining 60 were attributed to accident or negligence. Nine of these were referred to vehicles in the streets, 8 to drowning, 2 to sunstroke, and 6 (of infants under one year of age) to suffocation in bed.

# Cases of Infectious Sickness in Hospitals.†

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 27 cases of small-pox, 2781 of scarlet fever, 753 of diphtheria, and 83 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:-Of small-pox, 9 cases,

^{*} Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are, for the purposes of Tables 1, 6, and 7, the figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

against 5, 3, and 8; of scarlet fever, 352 cases, against 305, 297, and 318; of diphtheria, 109 cases, against 99, 75, and 132; and of enteric fever, 15 cases, against 13, 13, and 12.

#### GREATER LONDON.

In Greater London 3351 births and 1796 deaths were registered, corresponding to annual rates of 28·3 and 15·2 per 1000 of the estimated population. In the Outer Ring, 37 deaths from measles, 2 from scarlet fever, 3 from diphtheria, 21 from whooping-cough, 2 from "fever," and 6 from diarrhoa were registered. Six deaths from measles occurred in Canning Town, 5 in Croydon, and 4 in Brentford sub-districts; 8 deaths from whooping-cough occurred in West Ham, 5 in Brentford, and 5 in Edmonton districts.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.59 inches, and that of the Thermometer 62°.4, the latter being 4°.0 above the week's average in the 50 years 1841–90. The direction of the wind was variable, the horizontal movement of the air being 10 per cent. below the week's average in the 16 years 1860–75. The duration of registered bright sunshine in the week was 38.7 hours. The measured rainfall amounted to 1.45 inches.

#### RETURNS OF LONDON WATER COMPANIES.

The LONDON WATER COMPANIES have been good enough to furnish the following account of the number of services and the average daily amount of water supplied during the month of May 1896. The supply was in the ratio of 263 gallons to one service.

COMPANIES.	Number of	Services.	Daily Suppl in Ga	
	MAY. 1895.	MAY. 1896.	MAY. 1895.	MAY. 1896.
TOTAL SUPPLY	815,613	829,713	231,824,748	218,551,479
From Thames	394,111 421,502	400,799 428,914	117,493,442 114,331,306	115,238,887 103,312,592
THAMES, Chelsea West Middlesex Southwark and Vauxhall Grand Junction Lambeth	36,766 78,797 117,830 59,669 101,049	37,062 80,194 119,164 60,421 103,958	13,369,592 22,438,567 37,338,489 19,872,954 24,473,840	13,181,795 22,347,785 34,384,559 20,052,584 25,272,164
LEA AND OTHER SOURCES.  New River East London Kent	158,433 181,427 81,642	160,115 185,769 83,030	40,808,000 55,013,530 18,509,776	38,502,000 47,061,873 17,748,719

Note.—The Return for May 1896, as compared with that for the corresponding month of 1895, shows an increase of 14,100 services and a decrease of 13,273,269 gallons of water supplied daily.

#### Analysis of Metropolitan Water Supply during May, 1896.

Water-analysis Laboratory, The Yews, Reigate, 8th June, 1896.

SIR,

I HAVE to report to you the results of the chemical analysis, and of the physical and bacterioscopic examination, of the waters supplied to the inner, and portions of the outer, circle of the Metropolis during the month of May.

At the request of the Associated Metropolitan Water Companies, I have extended these monthly examinations to (a) the chemical and bacterioscopic condition of the raw river water at the intakes of the various Companies, and (b) to the bacteriology of the water as it issues from the filter beds of each Company, and before it is pumped into the distributing mains.

I append, also, the results obtained in the analyses of the waters supplied to Birmingham and Glasgow by their respective Corporations. These analyses were made by Dr. Hill of Birmingham and Dr. Mills of Glasgow.

#### RESULTS OF ANALYSIS EXPRESSED IN PARTS PER 100,000.

Analysed by Dr. Alfred Hill, F.I.C., Medical Officer of Health and Analyst to the City.
 Analysed by Dr. E. J. Mills, F.R.S., of the Glasgow and West of Scotland Technical College.

All the numbers in columns 4, 5, 6, 7, 8, 9, 10, and 11, relate to 100,000 parts of the waters. The Table is to be read thus:—the Thames at the Grand Junction Company's intake at Hampton, collected on the 12th of May 1896, had a temperature of 17 °2° C.; 100,000 lbs. of it contained 26 '80 lbs. of solid matter; the organic substances, constituting a portion of this matter, contained '186 lb. of carbon and '045 lb. of nitrogen. The above quantity of water also contained '016 lb. of ammonia and '178 lb. of nitrogen in the form of nitrates and nitrites, whilst the total amount of combined nitrogen in every form was '236 lb. The above weight of water also contained 1.7 lb. of chlorine, and 19.7 lbs. of carbonate of lime, or an equivalent quantity of other hardening or soap-destroying ingredients.

The numbers in the analytical Table can be converted into grains per imperial gallon by multiplying them by 7, and then moving the decimal point one place to the left. The same operation transforms the hardness in the Table into degrees of hardness on Clark's scale.

Taking the average amount of organic impurity in a given volume of the Kent Company's water during the nine years ending December 1876 as unity, the proportional amount contained in an equal volume of water supplied by each of the Metropolitan Water Companies and by the Tottenham Local Board of Health, was:—Kent 0.8, New River 1.1, Tottenham 1.5, East London (deep-well) 1.7, Colne Valley 1.9, Southwark 2.0, West Middlesex 2.1, Chelsea and Grand Junction 2.2, Lambeth 2.3, and East London (river supply) 2.6. The unfiltered river waters contained the following proportions:—Thames at Hampton 3.9, New River Cut 2.1, and the Lea at Angel Road 3.3.

The Thames at Hampton was, on May 12th, turbid and pale yellow in colour. It was of good quality, both chemically and bacterially, and after 13 days storage by the Lambeth Company it contained only 140 microbes or their spores per c.c. As delivered by the five Companies drawing from this river the water was, in every case, efficiently filtered, and of most excellent bacterial quality. The bacterial improvement effected by the various Companies is expressed by the following per-centage numbers:—Chelsea 98·84, West Middlesex 99·81, Southwark (No. 4 filter) 99·22, (No. 5 filter) 97·28, Grand Junction (general well at Hampton) 98·45, (general well at Kew) 96·12, and Lambeth 99·61.

The New River Cut, before entering the storage and subsidence reservoirs, was, on May 13th, turbid and very pale yellow in colour. It was, for raw water, of excellent chemical and bacterial quality, and after 6 days storage contained only 620 bacteria per c.c. After efficient filtration, the water was delivered in most excellent chemical and bacterial condition excelling, as regards organic purity, the majority of the deep-well waters. The bacterial improvement effected by this Company is expressed by the following percentage numbers:—general filter well 99·1 and wells Nos. 1 and 6, 99·7. The water, taken from the Lea at Angel Road by the East London Company on the 13th of May, was turbid and pale yellow in colour. It was, for raw water, of good chemical but bad bacterial quality. After filtration, the water was delivered by this Company of excellent chemical quality, but one of the samples contained a number of bacteria in excess of 100 per c.c. The bacterial improvement effected in the water by this Company is represented by the following per-centage numbers:—No. 1 Essex well 99·17, No. 2 Essex well 99·56, and Middlesex well 98·29.

The deep-well waters of the Kent, Colne Valley, and East London Companies, and of the Tottenham Local Board of Health, were of excellent chemical quality; but, with the exception of the Kent Company's water, were slightly turbid from suspended matters. The Colne Valley Company's water was softened before delivery and thus rendered suitable for washing.

Seen through a stratum two feet deep, the Kent and New River Companies waters were clear and colourless, the Colne Valley and Tottenham very slightly turbid and colourless, and the East London (deep well) water turbid, from suspended particles of chalk, and colourless. The remaining waters were clear and very pale yellow.

The bacterioscopic examination of the raw river waters, before and after storage, and of the supplies delivered by the various Companies and collected on the 12th, 13th, and 15th of May yielded the results contained in the following table:—

Description.	Microbes per c.c.	Temp. C.
RAW AND STORED RIVER WATERS.  Thames at Hampton, May 12th  "after storage for 13 days (Chelsea Company), May 12th  "after storage for 13 days (Chelsea Company), May 12th  "after storage for 13 days (Chelsea Company), May 12th  "at Lambeth "bar of the storage for 15 days (East London Company) at Kew passing to filters 2-6, May 13th  arriving at Kew passing to filters 2-6, May 13th  arriving at Kew prom Hampton, May 13th  New River Cut before passing through reservoirs, May 13th  "after passing through reservoirs, May 13th  "after passing through reservoirs, May 13th  River Lea at Angel Road, May 13th  "after storage for 15 days (East London Company), May 13th	2,060 140 1,080 280 380 700 1,340 620 300 8,180	17°2 15°3 15°7 14°7 16°2 15°8 17°4 16°8 17°4 17°3

Kent Company's new well at Deptford, May 15th -	146	, 11*3

Dr. Hill, F.I.C., Medical Officer of Health for Birmingham, reports that the water supplied to that city was "very slightly turbid and of a greenish-grey colour in a two-foot tube."

Dr. Mills, F.R.S., of the Glasgow and West of Scotland Technical College, reports that the water supplied to that city from Loch Katrine was "light brown in colour, and contained a "little suspended matter. The temperature was unusually high."

The Registrar General, &c. &c.

I am, &c. E. FRANKLAND.

umbers in this column are the average weekly Deaths for the ten years 1886-95, raised by 5°541 per cent for increase of population, cases of small-pox only are returned as "vaccinated" or as "uaraccinated" which are so certified by registered medical mea. When al attendant does not sertify that the deceases has, or has not, been vaccinated, or when the cause of death is not certified by a registered or, the case is returned under the heading" no statement." "vidence, at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of accident, murder, biter, or suiteide. All such cases are classed under "accident."

General Register Office, Somerset House, June 22nd, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 17.3 per 1000 of their aggregate copulation, which is estimated* at 10,846,948 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphapetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending				Weeks	ending

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·0 in Norwich, in Birkenhead, and in Newcastle-on Tyne, 1·1 in Bristol and in Sunderland, 1·2 in Salford, 1·3 in London, 1·4 in West Ham, in Nottingham, and in Sheffield, 1·5 in Manchester, 1·6 in Gateshead, 2·2 in Oldham, and 3·8 in Hull; from scarlet fever, 1·0 in Salford; from whooping-cough, 1·1 in Sunderland, 1·6 in Cardiff, and 2·1 in Huddersfield; from "fever," 1·4 in Birkenhead; and from diarrhæa, 1·0 in Derby and in Liverpool, 1·5 in Salford, and 1·8 in Leicester. The 71 deaths from dinhtheria Liverpool, 1.5 in Salford, and 1.8 in Leicester. The 71 deaths from diphtheria included 40 in London, and 13 in Birmingham. No death from small-pox was registered in any of the thirty-three towns.

In the registration district of Gloucester 5 deaths from small-pox were registered last week, all the deceased persons having been residents of Gloucester municipal

borough.

LONDON.

In LONDON† 2511 BIRTHS and 1371 DEATHS were registered. Allowing for increase of population, the births were 130, and the deaths 81, below the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated to Including deaths of London occurring in the outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the Middlesex County Lunatic Asylum at Highgate Small-pox Hospital, in the Metropolitan Asylums Board Hospitals within Registration London. As far as Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are, for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 16.9, 17.3, and 16.5 in the preceding three weeks, further fell last week to 16.2. During the four weeks ending on Saturday last the death-rate averaged 16.7 per 1000, being 0.7 per 1000 below the mean rate in the corresponding periods of the ten years 1886–95.

The 1371 deaths included 107 from measles, 18 from scale fever, 40 from

diphtheria, 48 from whooping-cough, 10 from enteric fever, 47 from diarrhea and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 270 deaths were referred to these

diseases, being 49 above the corrected average weekly number.

The deaths from measles, which had been 98, 115, and 111 in the preceding three weeks, further fell last week to 107, but were 41 above the corrected average; 13 cases belonged to Battersea, 8 to Poplar, 6 to Kensington, 6 to Wandsworth, 5 to Chelsea, 5 to Hackney, 5 to Shoreditch, 5 to Bethnal Green, and 5 to St. George Southwark sanitary areas. The deaths from scarlet fever, which had been 19, 13, and 22 in the preceding three weeks, fell again last week to 18, the corrected average being 17; 3 cases belonged to Greenwich sanitary area. The deaths from diphtheria, which had been 40, 52, and 49 in the preceding three weeks, further fell last week to 40, but were 7 above the corrected average; 6 cases belonged to Poplar, 6 to Camberwell, and 5 to Islington sanitary areas. The deaths from whooping-cough, which had been 83, 86, and 58 in the preceding three weeks, further fell last week to 48, but were 5 above the corrected average; 6 cases belonged to Islington, 5 to Hackney, and 5 to Battersea sanitary areas. The fatal cases of enteric fever, which had been 8, 7, and 3 in the preceding three weeks, rose again last week to 10, the corrected average being 9. The deaths from diarrhea, which had been 10, 17, and 20 in the preceding three weeks, further rose last week to 47, but were 3 below the corrected average. Of the 47 deaths directly referred to diarrhea, 44 were of children under five years of age; 10 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 230,

213, and 183 in the preceding three weeks, further fell last week to 162, and were

56 below the corrected average.

The deaths attributed directly to influenza numbered 7, having been 6, 12, and 8

in the preceding three weeks.

Different forms of violence caused 58 deaths, concerning all but one of which inquests were held. Of these 58 deaths, 7 were cases of suicide, and 4 of execution, while the remaining 47 were attributed to accident or negligence. Four of these were referred to vehicles in the streets, 10 to drowning, 2 to sunstroke, and 10 (of infants under one year of age) to suffocation in bed.

## Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 41 cases of small-pox, 2811 of scarlet fever, 755 of diphtheria, and 76 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:-Of small-pox, 18 cases, against 3, 8, and 9; of scarlet fever, 309 cases, against 297, 318, and 352; of diphtheria, 91 cases, against 75, 132, and 109; and of enteric fever, 11 cases, against 13, 12, and 15.

#### GREATER LONDON.

In Greater London 3470 births and 1759 deaths were registered, corresponding to annual rates of 29.3 and 14.8 per 1000 of the estimated population. In the Outer Ring, 26 deaths from measles, 4 from scarlet fever, 10 from diphtheria, 14 from whooping-cough, 2 from "fever," and 8 from diarrhea were registered. Eight deaths from measles occurred in West Ham district and 7 in Brentford district; the 2 deaths from "fever" occurred in West Ham district.

#### METEOROLOGY!

The mean reading of the Barometer last week at Greenwich was 29.83 inches, and that of the Thermometer 66°·0, the latter being 6°·8 above the week's average in the 50 years 1841–90. The direction of the wind was variable, the horizontal movement of the air being 5 per cent. above the week's average in the 16 years 1860–75. The duration of registered bright sunshine in the week was 60·3 hours. The measured rainfall amounted to 0·04 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fover respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

# WEEKLY RETURN

#### LONDON BIRTHS AND DEATHS ΙN

### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Acgistrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 26. 1896. Vol. LVII.] WEEK ENDING SATURDAY, JUNE 27.

Price  $1\frac{1}{2}d$ .

General Register Office, Somerset House, June 29th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 16.9 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

	Weeks	ending			Weeks	ending	
Towns.	June June 6. 13.	June   June   20.   27.	Towns.	June 6.	June 13.	June 20.	June 27.

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·1 in Gateshead, 1·2 in Portsmouth, 1·3 in Croydon, in Cardiff, and in Manchester, 1.4 in West Ham, 1.5 in Sunderland, 2.0 in Nottingham, and 2.4 in Hull; from scarlet fever, 1.0 in Huddersfield and 1.2 in Salford; from whooping-cough, 1.0 in Birmingham, in Derby, and in Newcastleupon-Tyne; and from diarrhea, 1·0 in London, in Cardiff, and in Norwich, 1·1 in Nottingham, 1·2 in Manchester, 1·4 in Birmingham and in Sheffield, 1·8 in Wolverhampton, 2.3 in Preston and in Leeds, 2.6 in Liverpool, 2.7 in Salford, and 2.9 in Leicester and in Birkenhead. In no case did the death-rate from "fever" reach 1.0 per 1000 in any of the thirty-three towns. The 59 deaths from diphtheria included 37 in London, 5 in Sheffield, 3 in Croydon, and 3 in Birmingham. One death from small-pox was registered belonging to London, but not one belonging to any other of the thirty-three towns.

In the registration district of Gloucester 3 deaths from small-pox were registered last week, all the deceased persons having been residents of Gloucester municipal

borough.

LONDON.

In London't 2501 BIRTHS and 1370 DEATHS were registered. Allowing for increase of population, the births were 101, and the deaths 79, below the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 17·3, 16·5, and 16·2 in the preceding three weeks, was again 16·2 last week. During the four weeks ending on Saturday last the death-rate averaged 16·6 per 1000, being 0·6 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1370 deaths included 1 from small-pox, 79 from measles, 15 from scarlet fever, 37 from diphtheria, 60 from whooping-cough, 5 from enteric fever, 1 from an ill-defined form of continued fever, 89 from diarrhæa and dysentery, 3 from choleric diarrhæa, and not one death from typhus; thus, 290 deaths were referred to these

diseases, being 53 above the corrected average weekly number.

The death from small-pox was that of a woman who had been removed from Paddington sanitary area to the hospital ship "Atlas." The deaths from measles, which had been 115, 111, and 107 in the preceding three weeks, further fell last week to 79, but were 16 above the corrected average; 8 cases belonged to Poplar, 6 to Shoreditch, 6 to Camberwell, 5 to Islington, 4 to Kensington, 4 to Hackney, 4 to Whitechapel, 4 to Mile End Old Town, and 4 to Plumstead sanitary areas. The deaths from scarlet fever, which had been 13, 22, and 18 in the preceding three weeks, further fell last week to 15, and were 2 below the corrected average; 3 cases belonged to Camberwell sanitary area. The deaths from diphtheria, which had been 51, 49, and 40 in the preceding three weeks, further fell last week to 37, but were 5 above the corrected average; 7 cases belonged to Camberwell, 6 to Islington, and 5 to Hackney sanitary areas. The deaths from whooping-cough, which had been 86, 58, and 48 in the preceding three weeks, rose again last week to 60, exceeding the corrected average by 18; 6 cases belonged to St. Pancras and 6 to Battersea sanitary areas. The fatal cases of enteric fever, which had been 7, 3, and 10 in the preceding three weeks, fell again last week to 5, the corrected average being 9. The deaths from diarrhea, which had been 17, 20, and 47 in the preceding three weeks, further rose last week to 89, and were 19 above the corrected average. Of the 89 deaths directly referred to diarrhea, 85 were of children under 5 years of age; 25 more deaths at this age-period were described as due to gastroenteritis, and are included under the heading "enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 213, 183, and 162 in the preceding three weeks, further fell last week to 153, and were

49 below the corrected average.

Only one death was attributed directly to influenza last week, the numbers

having been 12, 8, and 7 in the preceding three weeks.

Different forms of violence caused 53 deaths, concerning all but one of which inquests were held. Of these 53 deaths, 3 were cases of suicide, and 4 of homicide, while the remaining 46 were attributed to accident or negligence. Nine of these were referred to vehicles in the streets, 4 to conflagrations, 5 to drowning, one to sunstroke, and 6 (of infants under one year of age) to suffocation in bed.

### Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 32 cases of small-pox, 2882 of scarlet fever, 749 of diphtheria, and 75 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 6 cases, against 8, 9, and 18; of scarlet fever, 322 cases, against 318, 352, and 309; of diphtheria, 112 cases, against 132, 109, and 91; and of enteric fever, 15 cases, against 12, 15, and 11.

GREATER LONDON.

In Greater London 3471 births and 1758 deaths were registered, corresponding to annual rates of 29·3 and 14·8 per 1000 of the estimated population. In the Outer Ring, 29 deaths from measles, 4 from scarlet fever, 7 from diphtheria, 20 from whooping-cough, 6 from "fever," and 14 from diarrhæa were registered. Six deaths from measles occurred in Brentford, 4 in Croydon, 4 in Canning Town, 3 in Carshalton, and 3 in Forest Gate sub-districts; 3 deaths from diphtheria occurred in Croydon sub-district; 2 deaths from "fever" occurred in Tottenham and 2 in East Ham sub-districts.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.94 inches, and that of the Thermometer 61°.4, the latter being 0°.3 above the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 11 per cent. below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 26.0 hours. The measured rainfall amounted to 0.19 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or: Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of lation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of his not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of lent, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measu Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in easy Sub-district during the Week ending Saturday, 27th June, 1896.

# WEEKLY RETURN

#### IN LONDON DEATHS BIRTHS AND

### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 27. 1896. Vol. LVII. WEEK ENDING SATURDAY, JULY 4.

Price  $1\frac{1}{2}d$ .

General Register Office, Somerset House, July 6th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 17.8 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

	Weeks ending		Weeks	ending
Towns.	June   June   June   July   13.   20.   27.   4.	Towns.	June   June   20.	June July 27. 4.
Birkenhead Birmingham Blackburn Bolton Bradford Brighton Bristol Burnley Cardiff Croydon Derby Gateshead Halifax Huddersfield Hull Leeds Leicester	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	Sheffield Sunderland - Swansea West Ham	16·5 16·2 24·3 22·4 18·9 17·0 9·1 18·7 14·8 14·5 20·4 18·2 12·1 19·6 13·4 21·0	8.6 14.4 16.3 15.4 13.8 13.8 14.4 17.3 12.0 16.3 22.4 13.7 21.5 23.8 16.2 18.6 18.9 21.2 12.7 12.2 13.4 14.6

The highest annual death-rates per 1000 living, as measured by last week's mortality, were :- from measles, 1.0 in London, in West Ham, in Cardiff, and in Manchester, 1·1 in Nottingham and in Oldham, 1·2 in Salford and in Leeds, 1.9 in Sunderland, 4.0 in Hull, and 6.4 in Gateshead; from whooping-cough, 1.0 in Birkenhead and in Huddersfield, 1.1 in Halifax, and 1.2 in Wolverhampton; and from diarrhæa, 1.6 in Gateshead, 1.9 in Leeds, 2.0 in West Ham and in Liverpool, 2.4 in Sheffield, 2.7 in Salford, 3.8 in Birkenhead, and 5.0 in Leicester. In no case did the death-rate from scarlet fever or from "fever" reach 1.0 per 1000 in any of the thirty-three towns. The 64 deaths from diphtheria included 43 in London, 4 in Birmingham, and 3 in Liverpool. One death from small-pox belonging to London was registered, but not one belonging to any other of the thirty-three towns.

LONDON.

In London† 2446 BIRTHS and 1552 DEATHS were registered. Allowing for increase of population, the births were 139 below, and the deaths 8 above, the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 16.5, 16.2, and 16.2 in the preceding

^{*}By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated to Including deaths of persons not belonging to London occurring in the outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the Middlesex County Lunatic Asylum at Highgate Small-pox Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

D D

three weeks, rose again last week to 18.3. During the four weeks ending on Saturday last the death-rate averaged 16.8 per 1000, being 0.5 per 1000 below the mean

rate in the corresponding periods of the ten years 1886-95.

The 1552 deaths included 1 from small-pox, 81 from measles, 15 from scarlet fever, 43 from diphtheria, 60 from whooping-cough, 11 from enteric fever, 128 from diarrhæa and dysentery, 4 from cholera and choleraic diarrhæa, and not one death from typhus, or from any ill-defined form of continued fever; thus, 343 deaths were referred to these diseases, being 46 above the corrected average weekly number.

The death from small-pox was that of a child, aged 8 years, who had been removed from Islington sanitary area to the hospital ship "Castalia." The deaths from measles, which had been 111, 107, and 79 in the preceding three weeks, rose again last week to 81, and were 16 above the corrected average; 10 cases belonged to Battersea, 8 to St. Pancras, 7 to Poplar, and 6 to Mile End Old Town sanitary The deaths from scarlet fever, which had been 22, 18, and 15 in the preceding three weeks, were again 15 last week, the corrected average being 18. deaths from diphtheria, which had been 49, 40, and 37 in the preceding three weeks, rose again last week to 43, exceeding the corrected average by 10; 9 cases belonged to Islington, 4 to Hackney, 4 to Battersea, and 4 to Camberwell sanitary areas. The deaths from whooping-cough, which had been 58, 48, and 60 in the preceding three weeks, were again 60 last week, the corrected average being 44: 9 cases belonged to Islington and 7 to St. Pancras sanitary areas. The fatal cases of enteric fever, which had been 3, 10, and 5 in the preceding three weeks, rose again last week to 11, exceeding the corrected average by 3. The deaths from diarrhea, which had been 20, 47, and 89 in the preceding three weeks, further rose last week to 128, and exceeded the corrected average by 6. Of the 128 deaths directly referred to diarrhoa, 121 were of children under 5 years of age; 41 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 183, 162, and 153 in the preceding three weeks, rose again last week to 162, but were

34 below the corrected average.

The deaths attributed directly to influenza numbered 2, having been 8, 7, and

I in the preceding three weeks.

Different forms of violence caused 58 deaths, concerning all but 1 of which inquests were held. Of these 58 deaths, 8 were cases of suicide, and 1 of homicide, while the remaining 49 were attributed to accident or negligence. Five of these were referred to vehicles in the streets, 8 to drowning, 4 to sunstroke, 1 to the effects of chloroform administered for surgical purposes, and 6 (of infants under one year of age) to suffocation in bed.

CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 39 cases of small-pox, 2994 of scarlet fever, 760 of diphtheria, and 83 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 12 cases, against 9, 18, and 6; of scarlet fever, 359 cases, against 352, 309, and 322; of diphtheria, 103 cases, against 109, 91, and 112; and of enteric fever, 20 cases, against 15, 11, and 15.

GREATER LONDON.

In Greater London 3348 births and 1939 deaths were registered, corresponding to annual rates of 28·3 and 16·4 per 1000 of the estimated population. In the Outer Ring, 21 deaths from measles, 2 from scarlet fever, 9 from diphtheria, 19 from whooping-cough, 5 from "fever," and 41 from diarrhea were registered. Seven deaths from measles occurred in Brentford and 3 in Forest Gate sub-districts; 4 deaths from diphtheria occurred in Edmonton district; 4 deaths from whooping-cough occurred in Brentford and 3 in Tottenham sub-districts; 7 deaths from diarrhea occurred in Stratford and 5 in Willesden sub-districts.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.84 inches, and that of the Fhermometer 61°.3, the latter being 0°.1 below the week's average in the 50 years 1841–90. The direction of the wind was Westerly, the horizontal movement of the air being 45 per cent. above the week's average in the 16 years 1860–75. The duration of registered bright sunshine in the week was 29.7 hours. The measured rainfall amounted to 0.24 of an inch.

[•] The figures for the Hospitals represent patients certified on admission to be suffering from Small-por, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous,

a numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of tion.

Ose cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of s not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of the under, manufacture, or suicide. All such cases are classed under "accident."

Tible 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measing Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in each Sub-district during the Week ending Saturday, 4th July, 1896.

OF

# BIRTHS AND DEATHS IN LONDON

AND IN

## THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office,
AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 28. 1896. Vol. LVII.] WEEK ENDING SATURDAY, JULY 11.

Price 1 d.

General Register Office, Somerset House, July 13th, 1896.

#### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Thirty-three Great Towns of England and Wales corresponded to an annual rate of 19.9 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:—

		Weeks	ending	3	Weeks ending

Leicester -	16.8	16.3	17.8	17.8	

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·0 in West Ham, 1·1 in Oldham, in Sheffield, and in Sunderland, 1·3 in Manchester, 2·9 in Portsmouth, 3·2 in Gateshead, and 6·8 in Hull; from whooping-cough, 1·0 in Birkenhead, in Burnley, and in Huddersfield, 1·1 in Oldham, 1·2 in Blackburn, 1·3 in Croydon, 1·5 in Birmingham, 1·6 in Cardiff, and 1·8 in Wolverhampton; and from diarrhæa, 2·0 in Birmingham, 2·4 in London, 2·5 in Nottingham, 2·6 in Sheffield and in Sunderland, 3·3 in Liverpool, 3·4 in Leeds, 3·5 in Bolton, 3·7 in Leicester, 4·0 in Salford, 4·2 in Wolverhampton, and 4·3 in Birkenhead. In no case did the death-rate from scarlet fever or from "fever" reach 1·0 per 1000 in any of the thirty-three towns. The 64 deaths from diphtheria included 47 in London, 4 in Birmingham, and 3 in Liverpool. No death from small-pox was registered in any of the thirty-three towns.

A 92914.—2. 650.—7/96. Wt. 124.

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

## LONDON.

In LONDON* 2634 BIRTHS and 1770 DEATHS were registered. Allowing for increase of population, the births were 15 below, and the deaths 108 above, the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 16·2, 16·2, and 18·3 in the preceding three weeks, further rose last week to 20·9. During the four weeks ending on Saturday last the death-rate averaged 17.9 per 1000, being 0.1 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1770 deaths included 62 from measles, 11 from scarlet fever, 47 from diphtheria, 54 from whooping-cough, 1 from typhus, 6 from enteric fever, 208 from diarrhea and dysentery, 9 from cholera and choleraic diarrhea, and not one death from small-pox or from any ill-defined form of continued fever; thus, 398 deaths were referred to these diseases, being 15 above the corrected average weekly

The deaths from measles, which had been 107, 79, and 81 in the preceding three weeks, fell again last week to 62, but were 3 above the corrected average; 8 cases belonged to Battersea, 5 to Kensington, 5 to Islington, 5 to Bethnal Green, 5 to Lambeth, and 4 to Poplar sanitary areas. The deaths from scarlet fever, which had been 18, 15, and 15 in the preceding three weeks, further fell last week to 11, and were 8 below the corrected average. The deaths from diphtheria, which had been 40, 37, and 43 in the preceding three weeks, further rose last week to 47, and exceeded the corrected average by 14; 5 cases belonged to Islington, 4 to Lambeth, 3 to Shoreditch, 3 to Poplar, 3 to Bermondsey, and 3 to Greenwich sanitary areas. The deaths from whooping-cough, which had been 48, 60, and 60 in the preceding three weeks, fell again last week to 54, but were 10 above the corrected average; 8 cases belonged to Lambeth, 6 to Battersea, and 4 to Plumstead sanitary areas. The fatal cases of enteric fever, which had been 10, 5, and 11 in the preceding three weeks, fell again last week to 6, the corrected average being 9. The death of a male, who had been removed from Camberwell sanitary area to the South-Eastern Fever Hospital, was referred to typhus. The deaths from diarrhæa, which had been 47, 89, and 128 in the preceding three weeks, further rose last week to 208, the corrected average being 207. Of the 208 deaths from diarrhea, 198 were of children under 5 years of age; 60 more deaths at this age-period were described as due to gastroenteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 162, 153, and 162 in the preceding three weeks, fell again last week to 154, and were

37 below the corrected average.

The deaths attributed directly to influenza numbered 7, having been 7, 1, and

2 in the preceding three weeks.

Different forms of violence caused 65 deaths, concerning all but 1 of which inquests were held. Of these 65 deaths, 11 (including that of a boy, aged 12 years) were cases of suicide, and 5 of homicide, while the remaining 49 were attributed to accident or negligence. Seven of these were referred to vehicles in the streets, 6 to drowning, 1 to sunstroke, and 4 (of infants under one year of age) to suffocation in bed.

#### Cases of Infectious Sickness in Hospitals.†

According to returns from the Metropolitan Asylum and London Fever Hospitals. and from the Highgate Small-pox Hospital, there were 47 cases of small-pox, 3088 of scarlet fever, 758 of diphtheria, and 83 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:-Of small-pox, 11 cases, against 18, 6, and 12; of scarlet fever, 319 cases, against 309, 322, and 359; of diphtheria, 97 cases, against 91, 112, and 103; and of enteric fever, 11 cases, against 11, 15, and 20.

^{*} Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong,
† The figures for the Hospitals represent patients certified on amission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

### GREATER LONDON.

In Greater London 3539 births and 2202 deaths were registered, corresponding to annual rates of 29 9 and 18 6 per 1000 of the estimated population. In the Outer Ring, 16 deaths from measles, 1 from scarlet fever, 13 from diphtheria, 18 from whooping-cough, 6 from "fever," and 44 from diarrhoea were registered. Three deaths from measles occurred in Brentford, 3 in Willesden, and 3 in Stratford sub-districts; 4 deaths from diphtheria occurred in West Ham district; 6 deaths from whooping-cough occurred in West Ham and 5 in Edmonton districts; 4 deaths from "fever" occurred in West Ham district; 12 deaths from diarrhea occurred in Edmonton and 12 in West Ham districts.

DEATHS BELONGING to the SEVERAL SANITARY AREAS OF REGISTRATION LONDON registered in the 13 WEEKS ENDING on 27TH JUNE, 1896.

In the above Table all deaths of persons in, or on the way to, Hospitals and other Public Institutions, as well as those of persons under treatment in surgical homes, or dying by accident or otherwise in the streets, have been distributed, as far as practicable, to the sanitary areas in which the deceased had previously resided. The deaths of 411 London residents who died outside Registration London in the Islington Union Workhouse, Bowes Manor, the Strand Union Workhouse at Edmonton, the Holborn Union Workhouse at Mitcham, the City of London Lunatic Asylum at Stone, and the Metropolitan Hospitals and Asylums have been similarly distributed. In 461 cases the previous residence was outside Registration London, and these have been excluded from the Table.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.88 inches, and that of the Thermometer 68°.3, the latter being 6°.2 above the week's average in the 50 years 1841–90. The direction of the wind was South-Westerly, the horizontal movement of the air being 12 per cent. below the week's average in the 16 years 1860–75. The duration of registered bright sunshine in the week was 66.5 hours. The measured rainfall amounted to 0.03 of an inch.

#### RETURNS OF LONDON WATER COMPANIES.

The LONDON WATER COMPANIES have been good enough to furnish the following account of the number of services and the average daily amount of water supplied during the month of June 1896. The supply was in the ratio of 280 gallons to one service.

COMPANIES.	•	Number of	Services.	Daily Supp in Ga	
· · · · · · · · · · · · · · · · · · ·		JUNE. 1895.	JUNE. 1896.	JUNE. 1895.	JUNE. 1896.

Note.—The Return for June 1896, as compared with that for the corresponding month of 1895, shows an increase of 14,236 services and a decrease of 8,207,362 gallons of water supplied daily.

### Analysis of Metropolitan Water Supply during June, 1896.

Water-analysis Laboratory, The Yews, Reigate, 3rd July, 1896.

SIR,

I HAVE to report to you the results of the chemical analysis, and of the physical and bacterioscopic examination, of the waters supplied to the inner, and portions of the outer, circle of the Metropolis during the month of June.

At the request of the Associated Metropolitan Water Companies, I have extended these monthly examinations to (a) the chemical and bacterioscopic condition of the raw river water at the intakes of the various Companies, and (b) to the bacteriology of the water as it issues from the filter beds of each Company, and before it is pumped into the distributing mains.

I append, also, the results obtained in the analyses of the waters supplied to Birmingham and Glasgow by their respective Corporations. These analyses were made by Dr. Hill of Birmingham and Dr. Mills of Glasgow.

Taking the average amount of organic impurity in a given volume of the Kent Company's water during the nine years ending December 1876 as unity, the proportional amount contained in an equal volume of water supplied by each of the Metropolitan Water Companies and by the Tottenham Local Board of Health, was:—Kent 0.6, New River 1.1, Tottenham 1.3, East London (deep-well) 1.9, Colne Valley, Chelsea, and West Middlesez 2.1, Grand Junction 2.0, Southwark 2.2, Lambeth 2.4, and East London (river supply) 1.7. The unfiltered river waters contained the following proportions:—Thames at Hampton 3.7, New River Cut 2.2, and the Lea at Angel Road 5.4.

The Thames at Hampton was, on June 10th, turbid and pale yellow in colour. It was of good chemical but indifferent bacterial quality; and, even after 13 days storage by the Chelsea Company, the water supplying their filters still contained 980 microbes per c.c., whilst that supplying filter No. 5 of the Lambeth Company contained no less than 1,420 microbes per c.c. As delivered by the Chelsea, West Middlesex, and Lambeth Companies on the 10th and 11th of June the water, although efficiently filtered, contained an abnormally large number of microbes, and this was also the case with the water delivered into the general filter well at Kew Bridge, of the Grand Junction Company on the 11th, although that in the south filter well at the same works was of most excellent bacterial quality.

The New River Cut, before entering the storage and subsidence reservoirs, was, on June the 12th turbid and very pale yellow in colour. It was, for raw water, of excellent chemical but inferior bacterial quality. After efficient filtration, the water was delivered by the New River Company in

most excellent chemical and bacterial condition excelling, as regards organic purity, the majority of the deep-well waters. The bacterial improvement effected by this Company is expressed by the following percentage numbers:—general filter well 98.54, No. 3 filter well 99.27, and No. 7 filter well 99.02. The water, taken from the Lea at Angel Road by the East London Company on the 12th of June was turbid and pale yellow in colour, and it was of bad quality, both chemically and bacterially. After filtration, it was still very slightly turbid and contained, in all the three samples collected, a number of bacteria in excess of 100 per c.c. Nevertheless the bacterial improvement effected in the water by this Company is represented by the following high percentage numbers:—No. 1 Essex well 98.63, No. 2 Essex well 97.03, and Middlesex well 99.01.

The deep-well waters of the Kent and East London Companies, and of the Tottenham Local Board of Health were of excellent chemical quality; but the East London Company's water was slightly turbid, and that of the Tottenham Local Board of Health very slightly turbid The Colne Valley Company's water was softened before delivery and thus rendered suitable for washing; it contained however rather more organic matter than is usual in deep-well water.

Seen through a stratum two feet deep, the Kent, Colne Valley, and New River Companies waters were clear and colourless, the Tottenham very slightly turbid and colourless, the East London (deep well) slightly turbid and colourless, the Southwark very slightly turbid and very pale yellow, the East London (river supply) very slightly turbid and very pale yellow, and the remaining waters clear and very pale yellow.

The bacterioscopic examination of the raw river waters, before and after storage, and of the supplies delivered by the various Companies and collected on the 10th, 11th, 12th, 13th, and 22nd of June, yielded the results contained in the following table:—

Description.	Microbes per c.c.	Temp. C.
RAW AND STORED RIVER WATERS.  Thames at Hampton, June 10th "after storage for 13 days (Chelsea Company), June 10th June 22nd """ "6 "" (Lambeth "), June 10th June 22nd "" June 22nd West Middlesex Company's water passing on to filters 1-5, June 11th June 22nd Grand Junction water arriving at Kew from Hampton, June 11th " at Kew passing on to filters 2-6 " June 22nd New River Cut before passing through reservoirs, June 12th " atken between the " atken between the " after passing through reservoirs, before filtration, June 12th River Lea at Angel Road, June 12th " after storage for 15 days (East London Company), June 12th	6,760 980 1,320 1,420 1,140 640 1,360 520 460 720 1,640 780 420 11,720 2,340	18°3 18°3 19°8 18°4 19°8 20°5 18°6 19°3 20°5 18°6 18°7 18°6 18°7 18°2 19°3

DEEP-WELL.  Kent Company's new well at Deptford, June 13th	3 .	11.3

Dr. Hill, F.I.C., Medical Officer of Health for Birmingham, reports that the water supplied to that city from was "very slightly turbid and pale green in a two-foot tube."

Dr. Mills, F.R.S., of the Glasgow and West of Scotland Technical College, reports that the water supplied to that city from Loch Katrine was "light yellowish brown in colour, and contained a little suspended matter."

I am, &c.

E. FRANKLAND.

The Registrar General, &c. &c.

^{*} Analysed by Dr. Alfred Hill, F.I.C., Medical Officer of Health and Analyst to the City.
† Analysed by Dr. E. J. Mills, F.R.S., of the Glasgow and West of Scotland Technical College.

All the numbers in columns 4, 5, 6, 7, 8, 9, 10, and 11, relate to 100,000 parts of the waters. The Table is to be read thus:—the water at the Grand Junction Company's intake at Hampton, collected on the 10th of June 1896, had a temperature of 18·3° C.; 100,000 lbs. of it contained 25·80 lbs. of solid matter; the organic substances, constituting a portion of this matter, contained 194 lb. of carbon and 1023 lb. of nitrogen. The above quantity of water also contained 1010 lb. of ammonia and 154 lb. of nitrogen in the form of nitrates and nitrites, whilst the total amount of combined nitrogen in every form was 185 lb. The above weight of water also contained 1.8 lb. of chlorine, and 19.7 lbs. of carbonate of lime, or an equivalent quantity of other hardening or soap-destroying ingredients.

The numbers in the analytical Table can be converted into grains per imperial gallon by multiplying them by 7, and then moving the decimal point one place to the left. The same operation transforms the hardness in the Table into degrees of hardness on Clark's scale.

he numbers in this column are the average weekly deaths for the ten years 1850-30, raised by 5-511 per cent. for increase of ation.

hose cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical
When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of
tis not certified by a registered practitioner, the case is returned under the leading "no statement."

he evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of
the time, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Mean Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in Sub-district during the Week ending Saturday, 11th July, 1896.

'he highest annual death-rates per 1000 living, as measured by last week's tality, were:—from measles, 1.0 in West Ham, 1.2 in Plymouth, 1.3 in thton, 1.8 in Nottingham, 2.4 in Hull, 3.7 in Gateshead, and 4.1 in Portsth; from whooping-cough, 1.0 in West Ham and in Manchester, 1.2 in Salford, in Croydon, and 1.6 in Huddersfield; and from diarrhea, 3.4 in Manchester, in Bolton, 3.8 in Cardiff, 4.1 in London, 4.8 in Wolverhampton, in Birmingham, in Sheffield, 4.9 in Salford, 5.7 in Leeds, 6.0 in Liverpool, 7.5 in Plymouth, 9.2 in Leicester. In no case did the death-rate from scarlet fever or from ever reach 1.0 per 1000 in any of the thirty-three towns. The 72 deaths from htheria included 55 in London, 4 in West Ham, 3 in Liverpool, and 3 in Manster. No death from small-pox was registered in any of the thirty-three towns. LONDON.

LONDON† 2429 BIRTHS and 1891 DEATHS were registered. Allowing for rease of population, the births were 228 below, and the deaths 166 above, the average mbers in the corresponding weeks of the last ten years. The annual death-rate 1000 from all causes, which had been 16.2, 18.3, and 20.9 in the preceding see weeks, further rose last week to 22.3. During the four weeks ending on Saturday

By "estimated" population is merely meant the number of persons who would be living if the mean rat crease in the last intercensal period had since been maintained.

Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated die Registration London, but excluding deaths of persons not belonging to London occurring in the brate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at disworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as ticable, the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, and to the Outer Ring, or to other areas to which they belong.

4 92914.—8, 650.—7/96, Wt. 124.

last the death-rate averaged 19.4 per 1000, being 0.6 per 1000 above the mea

rate in the corresponding periods of the ten years 1886-95.

The 1891 deaths included 52 from measles, 20 from scarlet fever, 55 from diphtheria, 60 from whooping-cough, 1 from typhus, 2 from enteric fever, 1 from an ill-defined form of continued fever, 343 from diarrhæa and dysenter, 7 from cholera and choleraic diarrhæa, and not one death from small-pox; thu 541 deaths were referred to these diseases, being 111 above the corrected average weekly number.

The deaths from measles, which had been 79, 81, and 62 in the preceding three weeks, further fell last week to 52, and were 6 below the corrected average; 6 cas belonged to Fulham, 5 to St. Pancras, 5 to Lambeth, 4 to Kensington, and 4 Newington sanitary areas. The deaths from scarlet fever, which had been 1 15, and 11 in the preceding three weeks, rose again last week to 20, which is all the corrected average; 2 cases belonged to Islington, 2 to Mile End Old Tow. and 2 to Poplar sanitary areas. The deaths from diphtheria, which had been 3 43, and 47 in the preceding three weeks, further rose last week to 55, and were 2 above the corrected average; 5 cases belonged to Islington, 5 to Camberwell, 4 Kensington, 4 to Chelsea, 4 to Hackney, and 4 to St. Marylebone sanitary areas. deaths from whooping-cough, which had been 60, 60, and 54 in the preceding thre weeks, rose again last week to 60, and exceeded the corrected average by 15; 8 cas belonged to St. Pancras sanitary area. The fatal cases of enteric fever, which has been 5, 11, and 6 in the preceding three weeks, further fell last week to 2, the corrected average being 7. The death of a female, aged 9 years, at Aldens Road, Hammersmith, was certified as due to typhus. The deaths from diarrhee which had been 89, 128, and 208 in the preceding three weeks, further rose la week to 343, and were 86 above the corrected average. Of the 343 deaths from diarrhoa, 330 were of children under 5 years of age; 81 more deaths at this age period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 15 162, and 154 in the preceding three weeks, rose again last week to 165, but we 16 below the corrected average.

The deaths attributed directly to influenza numbered 6, having been 1, 2, an

7 in the preceding three weeks.

Different forms of violence caused 85 deaths, concerning all but 6 of whicinquests were held. Of these 85 deaths, 9 were cases of suicide and 1 of homicid while the remaining 75 were attributed to accident or negligence. Eight of the were referred to vehicles in the streets, 4 to a conflagration, 17 to drowning, 8 sunstroke, and 17 (including 15 of infants under one year of age) to suffocation bed.

#### Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospital and from the Highgate Small-pox Hospital, there were 40 cases of small-pox, 316 of scarlet fever, 745 of diphtheria, and 92 of enteric fever under treatment in the hospitals on Saturday last (Table 3). The admissions during the week, as compare with those in the preceding three weeks, were as follow:—Of small-pox, no cas against 6, 12, and 11 cases; of scarlet fever, 320 cases, against 322, 359, and 319 of diphtheria, 87 cases, against 112, 103, and 97; and of enteric fever, 19 case against 15, 20, and 11.

GREATER LONDON.

In Greater London 3353 births and 2391 deaths were registered, corresponding to annual rates of 28°3 and 20°2 per 1000 of the estimated population. In the Outer Ring, 16 deaths from measles, 4 from scarlet fever, 9 from diphtheria, 25 frow whooping-cough, 3 from "fever," and 75 from diarrhea were registered. Seve deaths from measles, 5 from diphtheria, 6 from whooping-cough, and 28 from diarrhea occurred in West Ham district; 8 from whooping-cough and 12 from diarrhea in Brentford district; 14 from diarrhea in Edmonton district; an 3 from diphtheria in Bromley sub-district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.96 inches, and that of II Thermometer 64°.9, the latter being 1°.9 above the week's average in the 50 years 1841-9. The direction of the wind was variable, the horizontal movement of the air being 6 per cen above the week's average in the 16 years 1860-75. The duration of registered bright sunshine the week was 39.5 hours. The measured rainfall amounted to 0.21 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pt Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital; to have been erroneous.

cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical
hen the medical attendant does not certify that the deceased has, or has not been vaccinated, or when the cause of
not certified by a registered practitioner, the case is returned under the heading "no statement."

widence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of
murder, manslaughter, or suicide. All such cases are classed under "accident."

The height of the cistern of the barometer is 159 feet above the mean level of the sea; no correction has been applied to the readings to reduce the sea level.  Observations are usually taken at 80 h. A. M.: noon; 3. P. M.; and 90. P. M. The means of the eye-readings of the barometer, the dry bulb thermometer, and the wet bulb thermometer, are	oversteal into near daily values by the application of corrections deduced from a discussion of the photographic records made during the twenty years ending 1873 for the barometer, and during the twenty years ending 1883 for the firemometers. With the corrected mean reading	of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily value of temperature of the air column 8). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wer buil), thermometers by Ghaisher's Hypro-	strical Tables.  The Average temperature of the air is that derived from a discussion of the observations and at Greenwich, Aminor the Grooms and in 1800, and that of horizontal novement of the	air from a discussion of the amounted to records for the 16 years ending 1875.  In reading the columns 9 and 24 it will be borne in mind that + is read "higher," and	Covers, when we strage.  The values given in column 17 are not corrected for the index error of the thermometer, hich cannot be determined.	The record of Electricity is derived from Thomson's self-registering instrument, symbols employed are:—P. positive; N. negative; w. weak; m., moderate; s. strong; v. variable  "The numbers in column 84 perived from the Campbell-Stokes Sunshine Instrument, stop corresponded anotion of bright machine control.	The reading of the barometer decreased from 30 '11 in, at the beginning of the week to 29 '78 in, by 3h, P.M. on the 15th; increased to 30 '09 in, by 9h, P.M. on the 17th; and was 30 '06 in, at the end of the week,

# WEEKLY RETURN

#### BIRTHS AND DEATHS IN LONDON AND IN

# THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE. E.C.

No. 30. 1896. Vol. LVII.] WEEK ENDING SATURDAY, JULY 25.

Price 1 d.

General Register Office, Somerset House, July 27th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Thirty-three Great Towns of England and Wales corresponded to an annual rate of 24.8 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending					Weeks	ending	
Towns.	July 4.	July 11.	July 18.	July 25.	Towns.		July 4.	July 11.	July 18.	July 25.

The highest annual death-rates per 1000 living, as measured by last week's mortality, were: -from measles, 1.0 in Manchester, 1.1 in Nottingham, 1.4 in Norwich, 1.5 in Derby, 1.8 in Oldham, 2.6 in Hull, 3.5 in Portsmouth, and 5.3 in Gateshead; from scarlet fever, 1.7 in Plymouth; from whooping-cough, 1.0 in Birmingham and in Birkenhead, 1.1 in Gateshead, 1.2 in Hull, 1.3 in Bolton, and 1.8 in Preston; and from diarrhea, 5.1 in Manchester, 5.3 in Gateshead, 5.4 in Salford, 5.6 in Bolton, 5.9 in London and in Hull, 6.1 in Burnley, 6.7 in Cardiff, 7.1 in Liverpool, 7.4 in West Ham, 8.4 in Wolverburnet, 8.6 in Cardiff, 7.1 in Liverpool, 7.4 in West Ham, 8.4 in Wolverburnet, 8.6 in Cardiff, 7.1 in Liverpool, 7.4 in West Ham, 8.4 in Wolverburnet, 8.6 in Cardiff, 7.1 in Liverpool, 7.4 in West Ham, 8.4 in Wolverburnet, 8.6 in Cardiff, 7.1 in Liverpool, 7.4 in West Ham, 8.4 in Wolverburnet, 8.6 in Cardiff, 8.7 in C hampton, 8.6 in Sheffield, 9.6 in Birmingham, and 13.6 in Leicester. In no case did the death-rate from "fever" reach 1.0 per 1000 in any of the thirty-three towns. The 74 deaths from diphtheria included 50 in London, 8 in Birmingham, 3 in West Ham, and 3 in Liverpool. No death from small-pox was registered in any of the thirty-three towns.

LONDON.

In LONDON† 2448 BIRTHS and 2146 DEATHS were registered. Allowing for increase of population, the births were 207 below, and the deaths 433 above, the average numbers in the corresponding weeks of the last ten years. The annual death-rate

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses. Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

per 1000 from all causes, which had been 18.3, 20.9, and 22.3 in the preceding three weeks, further rose last week to 25.3. During the four weeks ending on Saturday last the death-rate averaged 21.7 per 1000, being 2.1 per 1000 above the mean rate in the corresponding periods of the ten years 1886-95.

The 2146 deaths included 58 from measles, 17 from scarlet fever, 50 from diphtheria, 50 from whooping-cough, 10 from enteric fever, 503 from diarrhea and dysentery, 15 from cholera and choleraic diarrhea, and not one death from small-pox, from typhus, or from any ill-defined form of continued fever; thus, 703 deaths were referred to these diseases, being 262 above the corrected average weekly

number.

The deaths from measles, which had been 81, 62, and 52 in the preceding three weeks, rose again last week to 58, the corrected average being 56; 7 cases belonged to Battersea, 6 to Lambeth, 5 to Fulham, 4 to Hackney, and 4 to Shoreditch sanitary areas. The deaths from scarlet fever, which had been 15, 11, and 20 in the preceding three weeks, fell again last week to 17, and were 2 below the corrected average; 3 cases belonged to Islington sanitary area. The deaths from diphtheria, which had been 43, 47, and 55 in the preceding three weeks, fell again last week to 50, but exceeded the corrected average by 13; 7 cases belonged to Camberwell, 5 to Lambeth, and 4 to Poplar sanitary areas. The deaths from whooping-cough, which had been 60, 54, and 60 in the preceding three weeks, fell again last week to 50, but exceeded the corrected average by 7; 6 cases belonged to Islington, 4 to St. Pancras, and 4 to Woolwich sanitary areas. The fatal cases of enteric fever, which had been 11, 6, and 2 in the preceding three weeks, rose again last week to 10, which is also the corrected average; 3 cases belonged to Islington and 2 to St. Pancras sanitary areas. The deaths from diarrhea, which had been 128, 208, and 343 in the preceding three weeks, further rose last week to 503, exceeding the corrected average by 237. Of the 503 deaths from diarrhoa, 484 were of children under 5 years of age; 88 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 162, 154, and 165 in the preceding three weeks, fell again last week to 153, and were

26 below the corrected average.

One death was attributed directly to influenza, the numbers having been 2, 7,

and 6 in the preceding three weeks.

Different forms of violence caused 61 deaths, concerning all but 6 of which inquests were held. Of these 61 deaths, 3 were cases of suicide, while the remaining 58 were attributed to accident or negligence. Flight of these were referred to vehicles in the streets, 3 to drowning, 5 to sunstroke, 1 to the effects of chloroform administered for surgical purposes, and 5 (of infants under one year of age) to suffocation in bed.

## CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 37 cases of small-pox, 3207 of scarlet fever, 737 of diphtheria, and 98 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 6 cases, against 12, 11, and none; of scarlet fever, 321 cases, against 359, 319, and 320; of diphtheria, 94 cases, against 103, 97, and 87; and of enteric fever, 29 cases, against 20, 11, and 19.

GREATER LONDON.

In Greater London 3401 births and 2830 deaths were registered, corresponding to annual rates of 28.7 and 23.9 per 1000 of the estimated population. In the Outer Ring, 17 deaths from measles, 5 from scarlet fever, 11 from diphtheria, 23 from whooping-cough, 7 from "fever," and 158 from diarrhea were registered. Four deaths from measles, 6 from diphtheria, and 67 from diarrhea occurred in West Ham district; 5 from measles in Brentford sub-district; and 38 from diarrhea in Edmonton district.

METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.80 inches, and that of the Thermometer 67.5, the latter being 4.7 above the week's average in the 50 years 1841-90. The direction of the wind was Westerly, the horizontal movement of the air being 2 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 35.4 hours. No rain was measured during the week.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox. Scarlet Fever, Diphtheria, or; Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

#### BIRTHS AND DEATHS IN LONDON

#### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 31. 1896. Vol. LVII. WEEK ENDING SATURDAY, AUGUST 1. Price 13d.

> General Register Office, Somerset House, August 4th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 24.4 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphaetically arranged, corresponded to the following annual rates per 1000:—

		Weeks	ending				Weeks	ending	
Towns.	July 11.	July 18.	July 25.	Aug.	Towns.	July 11.	July 18.		Aug.

Huddersfield	14.0	21.8	16.6	15.1	Swansea			11.6	_
Hull	22.2	14.2	25.7	31.2	West Ham			31.7	
Leeds -	21.8	21.4	22.5	20.2	Wolverhampton -	23.5	18.7	30.7	28.9
Leicester -	17.8	23.6	26.8	27.6					

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.0 in Cardiff, 1.1 in Nottingham and in Gateshead, 1.2 in West Ham and in Newcastle-on-Tyne, 1.4 in Manchester, 1.7 in Brighton, 1.9 in Hull, 2.9 in Plymouth, and 4.1 in Portsmouth; from scarlet fever, 1.0 in Cardiff, in Leicester, and in Salford; from whooping-cough, 1.1 in Nottingham, 1.2 in Birmingham, and 1.3 in Croydon; from "fever," 1.0 in Norwich; and from diarrhea, 5.2 in London, 5.4 in London; Stoffield 5.8 in Portsmouth, 6.1 in Cardiff, 6.4 in Hull, 6.5 in Bolton and in Sheffield, 6.9 in Preston, 7.2 in West Ham, 7.6 in Liverpool, 7.7 in Salford, 7.8 in Wolverhampton and in Sunderland, 10.1 in Birmingham, and 12.3 in Leicester. The 66 deaths from diphtheria included 43 in London, 3 in Birmingham, and 3 in Birkenhead. No death from small-pox was registered in any of the thirty-three towns. LONDON.

In LONDON 2623 BIRTHS and 2058 DEATHS were registered. Allowing for increase of population, the births were 5, and the deaths 375, above the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 20.9, 22.3, and 25.3 in the preceding three weeks, fell again last week to 24.3. During the four weeks ending on Saturday

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asyluma situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highpate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asyluma it was the Metropolitan Asyluma Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

last the death-rate averaged 23.2 per 1000, being 3.7 per 1000 above the mean

rate in the corresponding periods of the ten years 1886-95.

The 2058 deaths included 59 from measles, 24 from scarlet fever, 43 from diphtheria, 47 from whooping-cough, 1 from typhus, 12 from enteric fever, 442 from diarrhœa and dysentery, 22 from cholera and choleraic diarrhœa, and not one death from small-pox, or from any ill-defined form of continued fever; thus, 650 deaths were referred to these diseases, being 236 above the corrected average weekly number.

The deaths from measles, which had been 62, 52, and 58 in the preceding three weeks, were 59 last week, exceeding the corrected average by 11; 7 cases belonged to Greenwich, 5 to Shoreditch, 4 to St. Pancras, 4 to Bethnal Green, 4 to Whitechapel, and 4 to Lambeth sanitary areas. The deaths from scarlet fever, which had been 11, 20, and 17 in the preceding three weeks, rose again last week to 24, the corrected average being 22; 3 cases belonged to St. Luke and 3 to Mile End Old Town sanitary areas. The deaths from diphtheria, which had been 47, 55, and 50 in the preceding three weeks, further fell last week to 43, but were 5 above the corrected average; 5 cases belonged to Chelsea, 4 to Shoreditch, 4 to Camberwell, 4 to Greenwich, and 3 to Marylebone sanitary areas. The deaths from whooping-cough, which had been 54, 60, and 50 in the preceding three weeks, further fell last week to 47, but were 9 above the corrected average; 7 cases belonged to Islington, and 5 to Camberwell sanitary areas. The fatal cases of enteric fever, which had been 6, 2, and 10 in the preceding three weeks, further rose last week to 12, the corrected average being 11; 2 cases belonged to Westminster, 2 to Hackney, and 2 to Lambeth sanitary areas. The death of a male, aged 10 years, who had been removed from Vauxhall Walk, Lambeth, to the South-Western Fever Hospital, was certified as due to typhus. The deaths from diarrhea, which had been 208, 343, and 503 in the preceding three weeks, fell again last week to 442, but were 195 above the corrected average. Of the 442 deaths from diarrhœa, 421 were of children under 5 years of age; 100 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 154, 165, and 153 in the preceding three weeks, further fell last week to 142, and were

40 below the corrected average.

The deaths attributed directly to influenza numbered 6, having been 7, 6, and 1

in the preceding three weeks.

Different forms of violence caused 71 deaths, concerning all but 5 of which inquests were held. Of these 71 deaths, 9 were cases of suicide, and 1 of homicide, while the remaining 61 were attributed to accident or negligence. Eight of these were referred to vehicles in the streets, 10 to drowning, 5 to sunstroke, 1 to the effects of chloroform administered for surgical purposes, and 5 (of infants under one year of age) to suffocation in bed.

CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 28 cases of small-pox, 3279 of scarlet fever, 710 of diphtheria, and 92 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, no case, against 11, none, and 6; of scarlet fever, 360 cases, against 319, 320, and 321; of diphtheria, 93 cases, against 97, 87, and 94; and of enteric fever, 16 cases, against 11, 19, and 29.

GREATER LONDON.

In Greater London 3522 births and 2682 deaths were registered, corresponding to annual rates of 29.7 and 22.6 per 1000 of the estimated population. In the Outer Ring, 20 deaths from measles, 5 from scarlet fever, 9 from diphtheria, 13 from whooping-cough, 2 from "fever," and 171 from diarrhea were registered. Six deaths from measles, 5 from diphtheria, 2 from "fever," and 61 from diarrhea occurred in West Ham district; 4 from measles and 33 from diarrhea in Edmonton district; and 5 from measles in Mitcham sub-district.

## METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.76 inches, and that of the Thermometer 62.44, the latter being 0.11 above the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 20 per cent below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 39.8 hours. The measured rainfall amounted to 0.65 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous;

e numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of tion.

lose cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of is not certified by a registered practitioner, the case is returned under the heading "no statement."

le evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of nt, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measure Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in Sub-district during the Week ending Saturday, 1st August, 1896.

OF

# BIRTHS AND DEATHS IN LONDON

AND IN

## THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office,
AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 32. 1896. Vol. LVII.] WEEK ENDING SATURDAY, AUGUST 8. [Price 1 d.

General Register Office, Somerset House, August 10th, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Thirty-there Great Towns of England and Wales corresponded to an annual rate of 21.4 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:—

		Weeks	ending	13.0	Weeks ending

				18.6	

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·4 in Sheffield, 1·8 in Oldham, 2·0 in Derby, 2·2 in Brighton, and 2·3 in Nottingham; from scarlet fever, 1·4 in West Ham; from whooping-cough, 1·2 in West Ham and 1·4 in Hull; from "fever," 1·2 in West Ham and in Wolverhampton; and from diarrhæa, 4·0 in Croydon, 4·3 in Norwich, 4·4 in Manchester, 4·5 in Leicester and in Sunderland, 4·6 in Derby and in Burnley, 4·7 in Portsmouth, 4·9 in Salford, 5·0 in Preston, 5·4 in West Ham, 5·6 in Sheffield, 6·1 in Bolton, 6·7 in Birmingham, 6·9 in Brighton, 7·2 in Wolverhampton, and 7·8 in Hull. The 73 deaths from diphtheria included 54 in London and 7 in Birmingham. No death from small-pox was registered in any of the thirty-three towns.

^{*} By "estimated " population is merely meant the number of persons who would be living if the mean rate of 'ncrease in the last intercensal period had since been maintained,

A 92914,-6, 650,-8/96, Wt. 124,

In LONDON* 2291 BIRTHS and 1790 DEATHS were registered. Allowing for increase of population, the births were 264 below, and the deaths 150 above, the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 22.3, 25.3, and 24.3 in the preceding three weeks, further fell last week to 21.1. During the four weeks ending on Saturday last the death-rate averaged 23.3 per 1000, being 3.4 per 1000 above the mean rate in the corresponding periods of the ten years 1886-95.

The 1790 deaths included 42 from measles, 15 from scarlet fever, 54 from diphtheria, 41 from whooping-cough, 10 from enteric fever, 328 from diarrhea and dysentery, 13 from cholera and choleraic diarrhoea, and not one death from smallpox, from typhus, or from any ill-defined form of continued fever; thus, 503 deaths were referred to these diseases, being 136 above the corrected average weekly

number.

The deaths from measles, which had been 52, 58, and 59 in the preceding three weeks, fell again last week to 42, and were 5 below the corrected average; 5 cases belonged to St. Pancras and 5 to Shoreditch sanitary areas. The deaths from scarlet fever, which had been 20, 17, and 24 in the preceding three weeks, fell again last week to 15, and were 3 below the corrected average; 2 cases belonged to Kensington, 2 to Hackney, and 2 to Lambeth sanitary areas. The deaths from diphtheria, which had been 55, 50, and 43 in the preceding three weeks, rose again last week to 54, and were 17 above the corrected average; 9 cases belonged to Camberwell, 4 to Chelsea, and 4 to Battersea sanitary areas. The deaths from whooping-cough, which had been 60, 50, and 47 in the preceding three weeks, further fell last week to 41, but were 8 above the corrected average; 7 cases belonged to St. Pancras, 6 to Camberwell, and 6 to Greenwich sanitary areas. The fatal cases of enteric fever, which had been 2, 10, and 12 in the preceding three weeks, were 10 last week, the corrected average being 11; 2 cases belonged to St. Pancras sanitary area. The deaths from diarrhæa, which had been 343, 503, and 441 in the preceding three weeks, further fell last week to 328, but were 115 above the corrected average. Of the 328 deaths from diarrhea, 315 were of children under 5 years of age; 71 more deaths at this age-period were described as due to gastroenteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 165, 153, and 142 in the preceding three weeks, were again 142 last week, and were 40

below the corrected average.

The deaths attributed directly to influenza numbered 2, having been 6, 1, and 6

in the preceding three weeks.

Different forms of violence caused 65 deaths, concerning all but 3 of which inquests were held. Of these 65 deaths, 9 were cases of suicide and 2 of homicide, while the remaining 54 were attributed to accident or negligence. Six of these were referred to vehicles in the streets, 1 to a conflagration, 4 to drowning, 2 to sunstroke, and 6 (including 5 of infants under one year of age) to suffocation in bed.

## CASES of INFECTIOUS SICKNESS in HOSPITALS.

According to returns from the Metropolitan Asylum and London Fever Hospitals and from the Highgate Small-pox Hospital, there were 22 cases of small-pox, 3369 of scarlet fever, 708 of diphtheria, and 100 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 5 cases, against none, 6, and none; of scarlet fever, 366 cases, against 320, 321, and 360; of diphtheria, 89 cases, against 87, 94, and 93; and of enteric fever, 22 cases, against 19, 29, and 16.

^{*} Including deaths of Londoners in the Metropolitan Workhouses. Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

† The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheris, or Enteric Fover respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

### GREATER LONDON.

In Greater London 3157 births and 2432 deaths were registered, corresponding to annual rates of 26.6 and 20.5 per 1000 of the estimated population. In the Outer Ring, 11 deaths from measles, 10 from scarlet fever, 12 from diphtheria, 22 from whooping-cough, 12 from "fever," and 136 from diarrhea were registered. Three deaths from measles, 8 from scarlet fever, 2 from diphtheria, 13 from whooping-cough, 7 from "fever," and 52 from diarrhea occurred in West Ham district; 3 from measles and 13 from diarrhea in Croydon district; 5 from whooping-cough and 15 from diarrhea in Brentford district; 9 from diarrhea in Willesden sub-district; 4 from diphtheria, 4 from whooping-cough, 2 from "fever," and 19 from diarrhea in Edmonton district, and 3 from "fever" in Hord sub-district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.89 inches, and that of the Thermometer 58.4, the latter being 3.9 below the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 23 per cent. below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 14.2 hours. The measured rainfall amounted to 0.36 of an inch.

### RETURNS OF LONDON WATER COMPANIES.

The London Water Companies have been good enough to furnish the following account of the number of services and the average daily amount of water supplied during the month of July 1896. The supply was in the ratio of 285 gallons to one service.

Note.—The Return for July 1896, as compared with that for the corresponding month of 1895, shows an increase of 14,097 services and of 4,730,069 gallons of water supplied daily.

## Analysis of Metropolitan Water Supply during July, 1896.

Water-analysis Laboratory, The Yews, Reigate, 27th July, 1896.

I have to report to you the results of the chemical analysis, and of the physical and bacterioscopic examination, of the waters supplied to the inner, and portions of the outer, circle of the Metropolis during the month of July.

At the request of the Associated Metropolitan Water Companies, I have extended these monthly examinations to (a) the chemical and bacterioscopic condition of the raw river water at the intakes of the various Companies, and (b) to the bacteriology of the water as it issues from the filter beds of each Company, and before it is pumped into the distributing mains.

I append, also, the results obtained in the analyses of the waters supplied to Birmingham and Glasgow by their respective Corporations. These analyses were made by Dr. Hill of Birmingham and Dr. Mills of Glasgow.

RESULTS OF ANALYSIS EXPRESSED IN PARTS PER 100,000.

	Column 1.	2.	3.	4.	5.	6.	7.	8.	9.	10.	11.

Analysed by Dr. Alfred Hill, F.I.C., Medical Officer of Health and Analyst to the City.
 Analysed by Dr. E. J. Mills, F.R.S., of the Glasgow and West of Scotland Technical College.

All the numbers in columns 4, 5, 6, 7, 8, 9, 10, and 11, relate to 100,000 parts of the waters. The Table is to be read thus:—the Thames water at the Grand Junction Company's intake at Hampton, collected on the 2nd of July, had a temperature of 17.2° C.; 100,000 lbs. of it contained 26.68 lbs. of solid matter; the organic substances, constituting a portion of this matter, contained 274 lb. of carbon and .030 lb. of nitrogen. The above quantity of water also contained .002 lb. of ammonia and .134 lb. of nitrogen in the form of nitrates and nitrites, whilst the total amount of combined nitrogen in every form was .166 lb. The above weight of water also contained 1.8 lb. of chlorine, and 18.3 lbs. of carbonate of lime, or an equivalent quantity of other hardening or soap-destroying ingredients.

The numbers in the analytical Table can be converted into grains per imperial gallon by multiplying them by 7, and then moving the decimal point one place to the left. The same operation transforms the hardness in the Table into degrees of hardness on ('lark's scale.

Taking the average amount of organic impurity in a given volume of the Kent Company's water during the nine years ending December 1876 as unity, the proportional amount contained in an equal volume of water supplied by each of the Metropolitan Water Companies and by the Tottenham Local Board of Health, was:—Kent and New River 1·1, Tottenham 1·3, Colne Valley 1·7, East London 1·8 (deep-well), East London 2·1 (river supply), Chelsea and Grand Junction 2·4, Southwark 2·5, and West Middlesex and Lamboth 2·8. The unfiltered river waters contained the following proportions:—Thames at Hampton 5·2, New River Cut 1·9, and the Lea at Angel Road 4·0.

The Thames at Hampton was, on July 2nd, turbid and yellow in colour. It was of bad chemical but moderately good bacterial quality; and, after 12 days storage by the Chelsea Company, the number of microbes per c.c. was reduced to less than one-fifth of the original amount. As delivered by the Chelsea, West Middlesex, Southwark, Grand Junction, and Lambeth Companies, it was in every case efficiently filtered, and, with one exception, of excellent bacterial quality. The bacterial improvement effected by the various Companies is expressed by the following percentage numbers:—Chelsea, 99·1, West Middlesex, 99·64, Southwark (No. 3 filter) 84·33, (No. 8 filter) 98·74, Grand Junction (general well at Hampton) 98·29, (general

well at Kew) 98.83, and Lambeth 99.1.

The New River Cut, before entering the subsidence and storage reservoir, was, on July 6th, turbid and very pale yellow in colour. It was of most excellent chemical, and moderately good bacterial, quality and, after storage for four days, the number of microbes was reduced to less than one-third. After efficient filtration, the water was delivered in most excellent chemical and bacterial condition excelling, as regards organic purity, the majority of the deep-well waters. The bacterial improvement effected by this Company is expressed by the following percentage numbers:—general filter well 98.67, No. 5 filter well 99.73, and No. 9 filter well 99.2. The water, taken from the Lea at Angel Road by the East London Company on the 6th of July was turbid and pale yellow in colour, and of moderate chemical and bacterial quality. After storage and filtration, it was delivered of good chemical and bacterial quality. The bacterial improvement effected in the water by this Company is expressed by the following percentage numbers:—No. 1 Essex well 98.79, No. 2 Essex well 97.76, and Middlesex well 98.66.

The deep-well waters of the Kent, Colne Valley, and East London Companies, and of the Tottenham Local Board of Health were of excellent chemical quality. The Tottenham water was very slightly turbid, but the remaining deep-well waters were clear and bright. The Colne Valley Company's water was softened before delivery and thus rendered suitable for washing.

Seen through a stratum two feet deep, the Kent, Colne Valley, and East London deep well waters were clear and colourless, the Tottenham very slightly turbid and colourless, the New River clear and nearly colourless, the remaining waters clear and very pale yellow.

The bacterioscopic examination of the raw river waters, before and after storage, and of the supplies delivered by the various Companies and collected on the 1st, 2nd, 3rd, and 6th of July, yielded the results contained in the following table:—

Description.	Microbes per c.c.	Temp. C.
RAW AND STORED RIVER WATERS. DEEP-WELL. Kent Company's new well at Deptford, July 1st	4	11.3

Dr. Hill, F.I.C., Medicai Officer of Health for Birmingham, reports that the water supplied to that city from was "very slightly turbid and green in a two-foot tube."

Dr. Mills, F.R.S., of the Glasgow and West of Scotland Technical College, reports that the water supplied to that city from Loch Katrine was "light brown in colour, and contained a little suspended matter,"

The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of thation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of its not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of lent, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Men Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhola, Violence, &c., registered in Sub-district during the Week ending Saturday, 8th August, 1896.

#### DEATHS INLONDON BIRTHS AND AND IN

### THIRTY-TWO OTHER GREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 33. 1896. Vol. LVII.] WEEK ENDING SATURDAY, AUGUST 15. Price  $1\frac{1}{2}d$ .

> General Register Office, Somerset House, August 17th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 19.9 per 1000 of their aggregate population, which is estimated* at 10,860,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

	Weeks	ending	-			Weeks	ending

The highest annual death-rates per 1000 living, as measured by last week's mortality, were :- from measles, 1.1 in Nottingham, 1.2 in Hull, 1.5 in Derby, 1.7 in Brighton, 2.5 in Oldham, and 2.6 in Portsmouth and in Gateshead; from scarlet fever, 1.1 in Oldham; from whooping-cough, 1.0 in Cardiff and in Salford, 1·2 in West Ham, and 2·1 in Huddersfield; from "fever," 1·1 in Sheffield; and from diarrhæa, 4·2 in Salford, 4·3 in Manchester, 4·5 in Sunderland, 4·6 in Birmingham, 4·8 in Gateshead, 5·0 in Hull, 5·2 in Bolton, 6·1 in Brighton and in Portsmouth, 6·2 in Norwich, 6·4 in Preston, and 6·6 in Wolverhampton. The 84 deaths from diphtheria included 59 in London, 7 in Birmingham, 6 in West Ham, and 3 in Liverpool. No death from small-pox was registered in any of the thirty-three towns.

LONDON. In LONDON* 2624 BIRTHS and 1666 DEATHS were registered. Allowing for increase of population, the births were 70 below, and the deaths 63 above, the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 25·3, 24·3, and 21·1 in the preceding

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

* Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated explains and London but excluding deaths of persons not belonging to London occurring in the outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospitals, in the Middlesex County Lunatic Asylum at Highgate Small-pox Hospital, in the Asylums Board Hospitals within Registration London. As far as wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable, the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

three weeks, further fell last week to 19.7. During the four weeks ending on Saturda last the death-rate averaged 22.6 per 1000, being 3.0 per 1000 above the mean

rate in the corresponding periods of the ten years 1886-95.

The 1666 deaths included 45 from measles, 23 from scarlet fever, 59 from diphtheria, 37 from whooping-cough, 18 from enteric fever, 217 from diarrhæa and dysentery, 11 from cholera and choleraic diarrhæa, and not one death from small pox, from typhus, or from any ill-defined form of continued fever; thus, 410 death were referred to these diseases, being 58 above the corrected average weekly number.

The deaths from measles, which had been 58, 59, and 42 in the preceding thre weeks, rose again last week to 45, exceeding the corrected average by 3; 6 case belonged to Mile End Old Town, 5 to Shoreditch, and 4 to Hackney sanitary areas. The deaths from scarlet fever, which had been 17, 24, and 15 in the preceding three weeks, rose again last week to 23, which is also the corrected average; cases belonged to Whitechapel and 4 to Camberwell sanitary areas. The death from diphtheria, which had been 50, 43, and 54 in the preceding three weeks further rose last week to 59, exceeding the corrected average by 24; 7 cases belonged to Islington, 5 to Lambeth, 4 to Mile End Old Town, and 4 to Camberwell sanitary areas. The deaths from whooping-cough, which had been 50, 47, and 41 in the preceding three weeks, further fell last week to 37, but were 6 above the corrected average. The fatal cases of enteric fever, which had been 10, 12, and 10 in the preceding three weeks, rose again last week to 18, exceeding the corrected average by 6; 2 cases belonged to Westminster, 2 to Poplar, and 2 to Camberwell sanitary areas. The deaths from diarrhæa, which had been 503, 441, and 328 in the preceding three weeks, further fell last week to 217, but were 16 above the corrected average. Of the 217 deaths from diarrhæa, 196 were of children under 5 years of age; 68 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 153, 142, and 142 in the preceding three weeks, further fell last week to 135, and were

39 below the corrected average,

The deaths attributed directly to influenza numbered 4, having been 1, 6, and 2

in the preceding three weeks.

Different forms of violence caused 59 deaths, concerning all but 6 of which inquests were held. Of these 59 deaths, 10 were cases of suicide and 2 of homicide, while the remaining 47 were attributed to accident or negligence. Seven of these were referred to vehicles in the streets, 4 to burns and scalds, 6 to drowning, and 6 (of infants under one year of age) to suffocation in bed.

CASES of INFECTIOUS SICKNESS in HOSPITALS.†

According to returns from the Metropolitan Asylum and London Fever Hospitals and from the Highgate Small-pox Hospital, there were 22 cases of small-pox, 3368 of scarlet fever, 691 of diphtheria, and 112 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 2 cases, against 6, none, and 5; of scarlet fever, 378 cases, against 321, 360, and 366; of diphtheria, 97 cases, against 94, 93, and 89; and of enteric fever, 29 cases, against 29, 16, and 22.

### GREATER LONDON.

In Greater London 3560 births and 2213 deaths were registered, corresponding to annual rates of 30.0 and 18.7 per 1000 of the estimated population. In the Outer Ring, 15 deaths from measles, 10 from diphtheria, 20 from whooping-cough, and 101 from diarrhoa were registered. Six deaths from measles, 7 from diphtheria, 10 from whooping-cough, and 36 from diarrhoa occurred in West Ham district; 4 deaths from measles, 3 from whooping-cough, and 21 from diarrhoa occurred in Edmonton district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.93 inches, and that of the Thermometer 60°.8, the latter being 1°.6 below the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 10 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 11.2 hours. The measured rainfall amounted to 0.59 of an inch.

[†] The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diegrosis is found, after sojourn in the Hospital, to have been erroneous.

the numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of antion.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of his not certified by a registered practitioner, the case is returned under the heading "no statement." the evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of lent, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Me Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in Sub-district during the Week ending Saturday, 15th August, 1896.

### WEEKLY RETURN

#### AND DEATHS IN LONDON BIRTHS AND IN

### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 34. 1896. Vol. LVII.] WEEK ENDING SATURDAY, AUGUST 22. [Price 1 d.

> General Register Office, Somerset House, August 24th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 18.0 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending		Weeks ending

Hull Leicester -	20.2	20.3	21.8	17·1 17·6	Wolverhampton - 28.9 24.7 27.1 21.1

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from meastes, 1.0 in Derby and in Manchester, 1.1 in Sheffeld and in Gateshead, and 2.6 in Brighton; from scarlet fever, 1.2 in Salford, and 1.5 in Oldham; from whooping-cough, 1.2 in Salford, and 1.4 in Preston; from "fever," 1.0 in Birkenhead and in Huddersfield, 1.3 in Bolton, and 1.4 in Hull; and from diarrhea, 3.0 in Nottingham, 3.1 in Birmingham and in Liverpool, 3.2 in Preston and in Gateshead, 3.3 in Sheffield, 3.8 in Norwich, 3.9 in Brighton, 4·0 in Plymouth and in Salford, 4·1 in Sunderland, 4·2 in Leicester, 5·3 in Portsmouth, and 7·2 in Wolverhampton. The 84 deaths from diphtheria included 59 in London, 5 in West Ham, and 4 in Birmingham. No death from small-pox was registered in any of the thirty-three towns.

#### LONDON.

In LONDON' 2498 BIRTHS and 1426 DEATHS were registered. Allowing for increase of population, the births were 96, and the deaths 104, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 24.3, 21.1, and 19.7 in the preceding

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pot Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as Practicable the deaths time excluded from Registration London are for the purposes of Tables 1, 6, and 7 added to the Outer Ring, or to other areas to which they belong.

three weeks, further fell last week to 16.8. During the four weeks ending on Saturday last the death-rate averaged 20.5 per 1000, being 1.5 per 1000 above the mean

rate in the corresponding periods of the ten years 1886-95.

The 1426 deaths included 28 from measles, 15 from scarlet fever, 59 from diphtheria, 24 from whooping-cough, 1 from typhus, 9 from enteric fever, 147 from diarrhæa and dysentery, 1 from cholera, and not one death from small-pox or from any ill-defined form of continued fever; thus, 284 deaths were referred to these diseases, being 32 below the corrected average weekly number.

The deaths from measles, which had been 59, 42, and 45 in the preceding three weeks, fell again last week to 28, and were 10 below the corrected average; 4 cases belonged to Islington, 3 to St. George Southwark, and 3 to Camberwell sanitary areas, The deaths from scarlet fever, which had been 24, 15, and 23 in the preceding three weeks, fell again last week to 15, and were 8 below the corrected average; 2 cases belonged to Bethnal Green, 2 to Whitechapel, and 2 to Wandsworth sanitary areas. The deaths from diphtheria, which had been 43, 54, and 59 in the preceding three weeks, were again 59 last week, exceeding the corrected average by 27; 6 cases belonged to St. Pancras, 5 to Islington, 4 to Chelsea, 4 to Lambeth, 4 to Camberwell, and 4 to Greenwich sanitary areas. The deaths from whooping-cough, which had been 47, 41, and 37 in the preceding three weeks, further fell last week to 24, and were 7 below the corrected average; 6 cases belonged to Islington and 3 to Kensington sanitary areas. The fatal cases of enteric fever, which had been 12, 10, and 18 in the preceding three weeks, fell again last week to 9, the corrected average being 12. The death of a man, aged 54 years, at Queen's Road, Hackney, was certified as due to typhus. The deaths from diarrhea, which had been 441. 328, and 217 in the preceding three weeks, further fell last week to 147, and were 26 below the corrected average. Of the 147 deaths from diarrhœa, 136 were of children under 5 years of age; 47 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 142, 142, and 135 in the preceding three weeks, rose again last week to 145, but were

23 below the corrected average.

The deaths attributed directly to influenza numbered 2, having been 6, 2, and 4

in the preceding three weeks.

Different forms of violence caused 56 deaths, concerning all but 5 of which inquests were held. Of these 56 deaths, 5 were cases of suicide and 2 of homicide, while the remaining 49 were attributed to accident or negligence. Six of these were referred to vehicles in the streets, 7 to drowning, and 11 (of infants under one year of age) to suffocation in bed.

CASES of INFECTIOUS SICKNESS in HOSPITALS. †

According to returns from the Metropolitan Asylum and London Fever Hospitals and from the Highgate Small-pox Hospital, there were 18 cases of small-pox, 3437 of scarlet fever, 707 of diphtheria, and 117 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 4 cases, against none, 5, and 2; of scarlet fever, 416 cases, against 360, 366, and 378; of diphtheria, 93 cases, against 93, 89, and 97; and of enteric fever, 20 cases, against 16, 22, and 29.

#### GREATER LONDON.

In Greater London 3425 births and 1856 deaths were registered, corresponding to annual rates of 28.9 and 15.7 per 1000 of the estimated population. In the Outer Ring, 6 deaths from measles, 3 from scarlet fever, 13 from diphtheria, 19 from whooping-cough, 4 from "fever," and 54 from diarrhæa were registered. Two deaths from measles, 9 from diphtheria, 7 from whooping-cough, and 21 from diarrhæa occurred in West Ham district; and 2 deaths from diphtheria occurred in Croydon sub-district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.82 inches, and that of the Thermometer 59.0, the latter being 20.4 below the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 20 per centbelow the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 23.2 hours. The measured rainfall amounted to 0.56 of an inch.

[†] The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox. Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital; to have been erroneous.

The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of ulation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical at the deceased has, or has not, been vaccinated, or when the cause of this not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of ident, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measi Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhæa, Violence, &c., registered in el Sub-district during the Week ending Saturday, 22nd August, 1896.

Osler's.	irection.	. w.	W X W E. N	WSW. & W	SW. & WSW	W. & N.	NNE. SSE.	WSW. & N.	NNW.*NW.	& N.	19	The results apply to the civil day, or from midnight to midnight,	The legin of the system of the abtometer is 139 feet above the main revel of the sea; independ has been applied to the readings to reduce the sea level.  Observations are usually taken at 9h.A.M.; noon; 3h.P.M.; and 9h.P.M. The means of the eye-radings of the bonneer, the dry bulb thermometer, and the week bulb thermometer, are converted into mean taily values by the application of corrections deduced from a discussion	of the photographic records made during the twenty years entiting 1873 for the barometer, and during the twinty years entiting 1888 for the thremometers. With the corrected mean reading of the dry built fibermometers to conclude the companion of the reading of the dry built fibermometers to conclude the companion of the readings of the readings.	and minimum thermometers, forming the mean daily value of temperature of the air column 8). The mean daily day point temperature and degree of humidity are deduced from the mean daily values of the dry and wet bulb, thermometer by Gaisher's Hyrro-	metrical Tables.  The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 80 years ending 1860, and that of horizonial movement of the first from a discussion of the amenometric records for the 10 years ending 1875.  In reading the columns 9 and 94 justile the former in mind that a 18 read "higher" and	"Movement the average. The values given in column 17 are not corrected for the index error of the thermometer, which cannot be determined.	The record of Blectricity is derived from Thomson's self-registering instrument, symbols employed are:—P. positive; N. negative; w. weak; m. moderate; s. strong; v. variable	The numbers in column 28, derived from the Campbell-Stokes Sunshine Instrument, show the uggregate duration of bright sunshine on each day.  The reaction of the becomeder impressed through 90.99 in at the becoming of the weak to 90.90 in	by 3h. A.M. on the 17th; decreased to 29°63 in. by 4h. P.M. on the 19th; increased to 29°75 in. by 3h. A.M. on the 20th; decreased to 29°06 in. by 5h. P.M. on the 2hst; and increased to 29°99 in. by the end of the week.

# WEEKLY RETURN

#### AND DEATHS IN LONDON BIRTHS

#### THIRTY-TWO OTHER GREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 35. 1896. Vol. LVII.] WEEK ENDING SATURDAY, AUGUST 29. [Price  $1\frac{1}{3}d$ .

> General Register Office, Somerset House, August 31st, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 17.4 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·1 in Oldham, 2·0 in Derby, and 2·1 in Gateshead; from scarlet fever, 1·0 in Birkenhead; from whooping-cough, 1·0 in Birkenhead, 1·1 in Sunderland, and 1·2 in Hull; from "fever," 1·4 in Sheffield, and 1·5 in Derby and in Sunderland; and from diarrhead, 2·0 in West Ham, in Salford, and in Burnley, 2·1 in Leicester, 2·2 in Newcastle-on-Tyne, 2·3 in Manchester, 2·4 in Birmingham, and in Birkenhead, 2·6 in Sheffield, 3·1 in in Manchester, 2.4 in Birmingham and in Birkenhead, 2.6 in Sheffield, 3.1 in Derby, 3.2 in Preston, 3.5 in Plymouth, 3.6 in Wolverhampton, and 4.3 in Bolton. The 59 deaths from diphtheria included 32 in London, 4 in West Ham, and 4 in Birmingham. No death from small-pox was registered in any of the thirty-three towns.

LONDON.

In London† 2651 BIRTHS and 1369 DEATHS were registered. Allowing for increase of population, the births were 1, and the deaths 75, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate

^{*}By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

per 1000 from all causes, which had been 21.1, 19.7, and 16.8 in the preceding three weeks, further fell last week to 16.1. During the four weeks ending on Saturday last the death-rate averaged 18.4 per 1000, being 0.1 per 1000 above the mean

rate in the corresponding periods of the ten years 1886-95.

The 1369 deaths included 19 from measles, 16 from scarlet fever, 32 from diphtheria, 26 from whooping-cough, 12 from enteric fever, 1 from an ill-defined form of continued fever, 92 from diarrhœa and dysentery, 5 from cholera and choleraic diarrhœa, and not one death from small-pox or from typhus; thus, 203 deaths were referred to these diseases, being 72 below the corrected average weekly number.

The deaths from measles, which had been 42, 45, and 28 in the preceding three weeks, further fell last week to 19, and were 12 below the corrected average; 3 cases belonged to Hackney and 3 to Mile End Old Town sanitary areas. deaths from scarlet fever, which had been 15, 23, and 15 in the preceding three weeks, were 16 last week, the corrected average being 23. The deaths from diphtheria, which had been 54, 59, and 59 in the preceding three weeks, fell again last week to 32, and were just equal to the corrected average; 4 cases belonged to Camberwell, 3 to Hackney, and 3 to Newington sanitary areas. The deaths from whooping-cough, which had been 41, 37, and 24 in the preceding three weeks, rose again last week to 26, but were 4 below the corrected average; 5 cases belonged to St. Paneras sanitary area. The fatal cases of enteric fever, which had been 10, 18, and 9 in the preceding three weeks, rose again last week to 12, and were just equal to the corrected average; 2 cases belonged to St. Marylebone, 2 to Hackney, and 2 to Battersea sanitary areas. The deaths from diarrhea, which had been 328, 217, and 147 in the preceding three weeks, further fell last week to 92, and were 48 below the corrected average. Of the 92 deaths from diarrhea, 83 were of children under 5 years of age; 23 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 142, 135, and 145 in the preceding three weeks, further rose last week to 149, and were

2 above the corrected average.

The deaths attributed directly to influenza numbered 2, having been 2, 4, and 2

in the preceding three weeks.

Different forms of violence caused 55 deaths, concerning all but 1 of which inquests were held. Of these 55 deaths, 3 were cases of suicide and 2 of homicide, while the remaining 50 were attributed to accident or negligence. Seven of these were referred to vehicles in the streets, 5 to drowning, and 9 (of infants under one year of age) to suffocation in bed.

Cases of Infectious Sickness in Hospitals.†

According to returns from the Metropolitan Asylum and London Fever Hospitals and from the Highgate Small-pox Hospital, there were 16 cases of small-pox, 3443 of scarlet fever, 698 of diphtheria, and 123 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 6 cases, against 5, 2, and 4; of scarlet fever, 333 cases, against 366, 378, and 416; of diphtheria, 86 cases, against 89, 97, and 93; and of enteric fever, 24 cases, against 22, 29, and 20.

GREATER LONDON.

In Greater London 3620 births and 1842 deaths were registered, corresponding to annual rates of 30.6 and 15.5 per 1000 of the estimated population. In the Outer Ring, 11 deaths from measles, 14 from diphtheria, 8 from whooping-cough, 7 from "fever," and 44 from diarrhea were registered. Six deaths from measles occurred in Edmonton district; 5 from diphtheria in West Ham district; and 4 from "fever" in Romford district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.79 inches, and that of the Thermometer 58°·1, the latter being 2°·6 below the week's average in the 50 years 1841-90. The direction of the wind was Westerly, the horizontal movement of the air being 15 per cent above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 18·3 hours. The measured rainfall amounted to 0·54 of an inch.

[†] The figures for the Hospitals represent patients certified on admission to be suffering from Small-por, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

he numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of ation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of h is not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of ent, murder, manslaughter, or suicide. All such cases are classed under "accident."

SW. &	18	100000000000000000000000000000000000000	The results apply of the cistern of the baronierer is 139 feet above the mean level of the sea, no correction has been applied to the readings to reduce the sea level.  Observations are usually taken at 9th A.M., noon; 3th R.M.; and 9th R.M. The means of the eye-readings of the baronierer, the dry bulb thermometer, and the wet bulb thermometer, are	converted into ment daily values by the application of corrections deduced from a discussion of the photographic records made during the twenty years ending 1873 for the barometer, and during the twenty years ending 1880 for the thermometers. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum	and minimum incrinometers, forming the mean darly value of temperature of the air (column 8). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wet build thermometer by Ghaisher's Hygrometrical Tables.	The average temperature of the arr is that derived from a discussion of the observations made at derenvich during the 50 years ending 1880, and that of horizontal movement of the air from a discussion of the anemonietric records for the 16 years ending 1875.	in recausing are contains a said 24 to will be bothe in mind that the result anguer, and in course fire in the average.  The values given in column 17 are not corrected for the index error of the thermometer, when the course given in column 17 are not corrected for the index error of the thermometer, when the course given in column 17 are not corrected for the index error of the thermometer, when the course given in column 17 are not corrected for the index error of the thermometer, and the column 17 are not considered for the index error of the contains the column 18 and 18 a	which cannot be determined.  The record of Electricity is derived from Thomson's self-registering Instrument.  symbols, employed are:P. positive; N. negative; w. weak; m. moderate; s. strong;	V. Whishole  The numbers in column 28, derived from the Campbell-Stokes Sunshine Instrument, show the number of bright sunshine on each day.  The reading of the barometer decreased from 29.59 in at the barinning of the week to 39.44 in.	by 2h. A.M. on the 26th; increased to 30.04 in. by 10h. P.M. on the 28th; and decreased to 29.91 in. by the end of the week.

#### BIRTHS AND DEATHS IN LONDON

### THIRTY-TWO OTHER GREAT TOWNS.

Bn Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 36. 1896. Vol. LVII.] WEEK ENDING SATURDAY, SEPTEMBER 5. [Price 1 d.

> General Register Office, Somerset House, September 7th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 16.5 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending		1				Weeks	ending	mi

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.0 in Manchester, 1.4 in Nottingham, and 1.7 in Hull; from scarlet fever, 1.5 in Oldham; from whooping-cough, 1.0 in Cardiff, in Birkenhead, and in Salford, and 1.8 in Preston; from "fever," 1.2 in Wolverhampton and 1.8 in Preston; and from diarrhea, 1.6 in Leicester, 1.7 in Liverpool, 1.8 in Wolverhampton, 2.1 in Manchester and in Hull, 2.2 in Brighton, 2.3 in Bristol and in Preston, and 2.6 in Sheffield. The 76 deaths from diphtheria included 49 in London, 6 in Birmingham, and 6 in Liverpool. No death from small-pox was registered in any of the thirty-three towns.

LONDON.

In London't 2449 BIRTHS and 1308 DEATHS were registered. Allowing for increase of population, the births were 190, and the deaths 99, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 19.7, 16.8, and 16.1 in the preceding three weeks, further fell last week to 15.4. During the four weeks ending on Saturday

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as Practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

last the death-rate averaged 17.0 per 1000, being 0.6 per 1000 below the mean

rate in the corresponding periods of the ten years 1886-95.

The 1308 deaths included 24 from measles, 16 from scarlet fever, 49 from diphtheria, 31 from whooping-cough, 14 from enteric fever, 69 from diarrheea and dysentery, 1 from cholera, and not one death from small-pox, from typhus, or from any ill-defined form of continued fever; thus, 204 deaths were referred to these

diseases, being 57 below the corrected average weekly number.

The deaths from measles, which had been 45, 28, and 19 in the preceding three weeks, rose again last week to 24, and were equal to the corrected average; 4 cases belonged to Lambeth sanitary area. The deaths from scarlet fever, which had been 23, 15, and 16 in the preceding three weeks, were again 16 last week, the corrected average being 25; 4 cases belonged to Greenwich and 3 to St. Marylebone sanitary areas. The deaths from diphtheria, which had been 59, 59, and 32 in the preceding three weeks, rose again last week to 49, exceeding the corrected average by 19; 6 cases belonged to Islington, 6 to Camberwell, 5 to Chelsea, and 4 to Poplar sanitary areas. The deaths from whooping-cough, which had been 37, 24, and 26 in the preceding three weeks, further rose last week to 31, but were 2 below the corrected average; 4 cases belonged to St. Pancras, 3 to Limehouse, and 3 to Newington sanitary areas. The fatal cases of enteric fever, which had been 18, 9, and 12 in the preceding three weeks, further rose last week to 14, the corrected average being 15; 2 cases belonged to Islington sanitary area. The deaths from diarrhea, which had been 217, 147, and 92 in the preceding three weeks, further fell last week to 69, and were 58 below the corrected average. Of the 69 deaths from diarrhoea, 61 were of children under 5 years of age; 25 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 135, 145, and 149 in the preceding three weeks, fell again last week to 135, and were 16

below the corrected average.

The deaths attributed directly to influenza numbered 2, having been 4, 2, and 2

in the preceding three weeks.

Different forms of violence caused 66 deaths, concerning all but 2 of which inquests were held. Of these 66 deaths, 12 were cases of suicide and 1 of homicide, while the remaining 53 were attributed to accident or negligence. Four of these were referred to vehicles in the streets, 4 to drowning, and 8 (of infants under one year of age) to suffocation in bed.

CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 16 cases of small-pox, 3610 of scarlet fever, 720 of diphtheria, and 134 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 2 cases, against 2, 4, and 6; of scarlet fever, 484 cases, against 378, 416, and 333; of diphtheria, 131 cases, against 97, 93, and 86; and of enteric fever, 31 cases, against 29, 20, and 24.

#### GREATER LONDON.

In Greater London 3330 births and 1669 deaths were registered, corresponding to annual rates of 28·1 and 14·1 per 1000 of the estimated population. In the Outer Ring, 7 deaths from measles, 7 from scarlet fever, 11 from diphtheria, 11 from whooping-cough, 5 from "fever," and 22 from diarrhea were registered. Three deaths from measles occurred in Mitcham sub-district; 2 deaths from scarlet fever in Hornsey sub-district; 4 from diphtheria in Edmonton district and 3 in West Ham district; and 3 from "fever" in West Ham district.

### METEUROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.67 inches, and that of the Thermometer 58.7, the latter being 1.00 below the week's average in the 50 years 1841-90. The direction of the wind was Variable, the horizontal movement of the air being 31 per cent below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 10.4 hours. The measured rainfall amounted to 1.22 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox-Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

on.

e cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical hen the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of not certified by a registered practitioner, the case is returned under the heading "no statement." syidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of murder, manslaughter, or suicide. All such cases are classed under "accident."

# WEEKLY RETURN

OF

## BIRTHS AND DEATHS IN LONDON

AND IN

#### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office,
AND SOLD BY EYRE AND SPOTTISWOODE. 9. EAST HARDING ST., FETTER LANE, E.C.

No. 37. 1896. Vol. LVII.] WEEK ENDING SATURDAY, SEPTEMBER 12. [Price 1 1/2 d.

General Register Office, Somerset House, September 14th, 1896.

### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 15.8 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:—

	Weeks e	ending					Weeks	ending	
Towns.	Aug.   Aug.   22.   29.	Sept.	Sept.	Towns.		Aug. 22.	Aug. 29.	Sept. 5.	Sept.

Leicester -	17.6 13.1	17.1	11.8						

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·3 in Brighton, and 1·9 in Hull; from whooping-cough, 1·0 in Burnley, and 1·1 in Nottingham; from "fever," 1·0 in Norwich and in Birkenhead, 1·2 in Hull, and 1·5 in Sunderland; and from diarrhæa, 1·0 in Cardiff, 1·2 in Plymouth and in Salford, 1·3 in Croydon and in Brighton, 1·4 in Norwich, in Nottingham, and in Birkenhead, 1·6 in West Ham, in Birmingham, in Blackburn, and in Gateshead, 1·8 in Preston, 2·4 in Liverpool, and 3·0 in Sunderland. In no case did the death-rate from scarlet-fever reach 1·0 per 1000 in any of the thirty-three towns. The 82 deaths from diphtheria included 48 in London, 5 in West Ham, 4 in Liverpool, 3 in Cardiff, 3 in Birmingham, and 3 in Manchester. No death from small-pox was registered in any of the thirty-three

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of in rease in the last intercensal period had since been maintained.

In LONDON* 2440 BIRTHS and 1251 DEATHS were registered. Allowing for increase of population, the births were 238, and the deaths 151, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 16.8, 16.1, and 15.4 in the preceding three weeks, further fell last week to 14.8. During the four weeks ending on Saturday last the death-rate averaged 15.8 per 1000, being 1.2 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1251 deaths included 12 from measles, 18 from searlet fever, 48 from diphtheria, 31 from whooping-cough, 14 from enteric fever, 61 from diarrhæa and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 184 deaths were referred to these diseases,

being 58 below the corrected average weekly number.

The deaths from measles, which had been 28, 19, and 24 in the preceding three weeks, fell again last week to 12, and were 8 below the corrected average. The deaths from scarlet fever, which had been 15, 16, and 16 in the preceding three weeks, further rose last week to 18, but were 7 below the corrected average; 4 cases belonged to Limehouse and 3 to Kensington sanitary areas. The deaths from diphtheria, which had been 59, 32, and 49 in the preceding three weeks, fell again last week to 48, but were 11 above the corrected average; 7 cases belonged to Islington, 6 to Camberwell, 5 to Lambeth, and 4 to Mile End Old Town sanitary areas. The deaths from whooping-cough, which had been 24, 26, and 31 in the preceding three weeks, were again 31 last week, the corrected average being 32; 4 cases belonged to St. Pancras, 4 to Clerkenwell, 4 to Newington, and 4 to Greenwich sanitary areas. The fatal cases of enteric fever, which had been 9, 12, and 14 in the preceding three weeks, were again 14 last week, the corrected average being 16; 2 cases belonged to St. Pancras and 2 to Mile End Old Town sanitary The deaths from diarrhea, which had been 147, 92, and 69 in the preceding three weeks, further fell last week to 61, and were 46 below the corrected average. Of the 61 deaths from diarrhoa, 54 were of children under 5 years of age; 23 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 145, 149, and 135 in the preceding three weeks, further fell last week to 118, and were 47

below the corrected average.

The deaths attributed directly to influenza numbered 3, having been 2 in each

of the preceding three weeks.

Different forms of violence caused 60 deaths, concerning all but 1 of which inquests were held. Of these 60 deaths, 14 were cases of suicide and 3 of homicide, while the remaining 43 were attributed to accident or negligence. Five of these were referred to vehicles in the streets, 9 to drowning, and 14 (of infants under one year of age) to suffocation in bed.

# CASES of INFECTIOUS SICKNESS in HOSPITALS.†

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 12 cases of small-pox, 3620 of searlet fever, 771 of diphtheria, and 148 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:-Of small-pox, one case, against 4, 6, and 2; of scarlet fever, 316 cases, against 416, 333, and 484; of diphtheria, 133 cases, against 93, 86, and 131; and of enteric fever, 28 cases, against 20, 24, and 31.

^{*} Including deaths of Londoners in the Metropolitan Workhouses. Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

**The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

#### GREATER LONDON.

In Greater London 3295 births and 1644 deaths were registered, corresponding to annual rates of 27.8 and 13.9 per 1000 of the estimated population. In the Outer Ring, 5 deaths from measles, 10 from diphtheria, 5 from whooping-cough, 6 from "fever," and 29 from diarrhea were registered. Six deaths from diphtheria occurred in West Ham district and 3 in Edmonton district; 3 deaths from "fever" occurred in West Ham district and 2 in Edmonton district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.62 inches, and that of the Thermometer 59.7, the latter being 1.2 above the week's average in the 50 years 1841-90. The direction of the wind was Variable, the horizontal movement of the air being 22 per cent. below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 7.8 hours. The measured rainfall amounted to 1.58 inches.

#### RETURNS OF LONDON WATER COMPANIES.

The London Water Companies have been good enough to furnish the following account of the number of services and the average daily amount of water supplied during the month of August 1896. The supply was in the ratio of 242 gallons to one service.

COMPANIES.	Number	of Services.	Daily Supp	ly of Water
	AUGUST.	AUGUST.	AUGUST.	August.
	1895.	1896.	1895.	1896.
TOTAL SUPPLY	819,247	833,343	216,891,923	201,499,333

	101,929	104,629	25,575,294	24,449,316
LEA AND OTHER SOURCES.  New River East London Kent	159,042	160,754	39,345,000	37,892,000
	182,454	186,819	43,828,978	35,226,296
	81,849	4 83,432.	17,377,437	16,347,143

Note.—The Return for August 1896, as compared with that for the corresponding month of 1895, shows an increase of 14,096 services and a decrease of 15,392,590 gallons of water supplied daily.

### Analysis of Metropolitan Water Supply during August, 1896.

Water-analysis Laboratory, The Yews, Reigate, 5th September, 1896.

I have to report to you the results of the chemical analysis, and of the physical and bacterioscopic examination, of the waters supplied to the inner, and portions of the outer, circle of the Metropolis during the month of August.

At the request of the Associated Metropolitan Water Companies, I have extended these monthly examinations to (a) the chemical and bacterioscopic condition of the raw river water at the intakes of the various Companies, and (b) to the bacteriology of the water as it issues from the filter beds of each Company, and before it is pumped into the distributing mains.

I append, also, the results obtained in the analyses of the waters supplied to Birmingham and Glasgow by their respective Corporations. These analyses were made by Dr. Hill of Birmingham and Dr. Mills of Glasgow.

002

* Analysed by Dr. Alfred Hill, F.I.C., Medical Officer of Health and Analyst to the City. † Analysed by Dr. E. J. Mills, F.R.S., of the Glasgow and West of Scotland Technical College.

All the numbers in columns 4, 5, 6, 7, 8, 9, 10, and 11, relate to 100,000 parts of the waters. The Table is to be read thus:—the Thames water at the Grand Junction Company's intake at Hampton, collected on the 24th of August 1896, had a temperature of 18·3° C.; 100,000 lbs. of it contained 25·76 lbs. of solid matter; the organic substances, constituting a portion of this matter, contained 2011 lb. of carbon and '043 lb. of nitrogen. The above quantity of water also contained '012 lb. of ammonia and '127 lb. of nitrogen in the form of nitrates and nitrites, whilst the total amount of combined nitrogen in every form was '180 lb. The above weight of water also contained 1·9 lb. of chlorine, and 17·4 lbs. of carbonate of lime, or an equivalent quantity of other hardening or soap-destroying ingredients.

The numbers in the analytical Table can be converted into grains per imperial gallon by multiplying them by 7, and then moving the decimal point one place to the left. The same operation transforms the hardness in the Table into degrees of hardness on Clark's scale.

Taking the average amount of organic impurity in a given volume of the Kent Company' water during the nine years ending December 1876 as unity, the proportional amount contained in an equal volume of water supplied by each of the Metropolitan Water Companies and by the Tottenham Local Board of Health, was:—Kent 0.8, New River and Tottenham 1.3, Colne Valley 1.4, East London (deep-well) 1.5, West Middlesex 2.0, Southwark 2.1, Chelsea and Grand Junction 2.2, East London (river supply) 2.3, and Lambeth 2.5. The unfiltered river waters contained the following proportions:-Thames at Hampton 4.1, New River Cut 2.0, and

the Lea at Angel Road 4.0.

The Thames at Hampton was, on August 24th, turbid and yellow in colour. It was of moderate chemical, but fairly good bacterial quality. After storage for 13 days by the Chelsea Company, the number of microbes per c.c. was reduced to less than one-eighth of the original amount. As delivered by the Chelsea, West Middlesex, Grand Junction, and Lambeth Companies it was in every case efficiently filtered, but the Southwark Company's supply was very slightly turbid, owing probably to a trace of oxide of iron derived from the mains. All the Thames-derived waters were of excellent chemical quality for dietetic use. They were also of very good bacterial quality. The bacterial improvement effected by the various Companies is expressed by the following percentage numbers:—Chelsea 98 97, West Middlesex 99 65, Southwark (No. 2 filter) 99 31, (No. 8 filter) 99.31, Grand Junction (general well at Hampton) 98.59, (general well at Kew) 98.24, (South well at Kew) 99.54, and Lambeth 96.55.

The New River Cut, before entering the subsidence and storage reservoir, was, on August 26th, turbid and pale yellow in colour. It was of most excellent chemical, and fairly good bacterial, quality and, after efficient filtration, it was delivered from the general filter well in most excellent chemical and bacterial condition, excelling, as regards organic purity, some of the deep-well waters. The bacterial improvement effected by this Company is expressed by the following percentage numbers:—general filter well 99 52, No. 6 filter well 99 52, and No. 8 well 77 14. The water taken from the Lea at Angel Road by the East London Company on August 26th was turbid and yellow in colour, and of moderate chemical but very bad bacterial quality. After filtration, it was still slightly turbid, but, for the most part, of good chemical and excellent bacterial quality, the bacterial improvement amounting to the following percentage numbers:-No. 1 Essex well

99.87, No. 2 Essex well 99.8, and Middlesex well 96.94.

The deep-well waters of the Kent, Colne Valley, and East London Companies, and of the Tottenham Local Board of Health were of excellent chemical quality, but the Tottenham water

was slightly turbid with oxide of iron. The remaining deep-well waters were bright, and that delivered by the Colne Valley Company was softened before delivery.

Seen through a stratum two feet deep, the New River, Kent, Colne Valley, and East London (deep well) waters were clear and colourless, the Tottenham slightly turbid and colourless, the Southwark and East London (river supply) very slightly turbid and very pale yellow, and the

remaining waters clear and very pale yellow.

The bacterioscopic examination of the raw river waters, before and after storage, and of the supplies delivered by the various Companies and collected on the 24th, 25th, and 26th of August,

yielded the results contained in the following table:-

Description.	Microbes per c.c.	Temp. C.
RAW AND STORED RIVER WATERS.  Thames at Hampton, August 24th  "after storage for 13 days (Chelsea Company), August 24th Lumbeth Company's water passing on to filter 5, August 24th Grand Junction "arriving at Kew from Hampton, August 25th  "at Kew passing on to filters 2-6, "at Kew River Cut before passing on to filters 1-5, August 25th  New River Cut before passing through reservoirs, August 25th  "atter passing through reservoirs, August 26th  "atter passing through reservoirs, before filtration, Aug. 26th  River Lea at Angel Rend, August 26th  "after storage for 15 days (East London Company), August 26th	200 600 520 500 300 840 760	18°3 18°7 18°5 19°3 19°3 18°4 16°6 17°0 17°6 18°5

Dr. Hill, F.I.C., Medicai Officer of Health for Birmingham, reports that the water supplied to that city from was "very slightly turbid and pale green in a two-foot tube."

Dr. Mills, F.R.S., of the Glasgow and West of Scotland Technical College, reports that the water supplied to that city from Loch Katrine was "light brown in colour, and contained a "little suspended matter."

The Registrar General, &c. &c.

I am, &c. E. FRANKLAND.

## WEEKLY RETURN

#### DEATHS IN LONDON BIRTHS AND

### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 38. 1896. Vol. LVII.] Week ending Saturday, September 19. [Price 1 d.

General Register Office, Somerset House, September 21st, 1896.

### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Thirty-three Great Towns of England and Wales corresponded to an annual rate of 15.1 per 1000 of their aggregate population, which is estimated* at 10,864,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

	Weel	s ending	3	17		Weeks	ending

Leicester -	13.1 17.	1 11.8	10.5					

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 2.6 in Gateshead; from scarlet fever, 1.0 in Birkenhead, and 1.5 in Salford; from whooping-cough, 2.1 in Swansea; from "fever," 1.1 in Gateshead; and from diarrhæa, 1.0 in Cardiff, in Norwich, in Birkenhead, in Salford, and in Burnley, 1·1 in Swansea and in Nottingham, 1·2 in Wolverhampton, 1·6 in Blackburn, 1·7 in Liverpool, 1·8 in Oldham, and 2·3 Preston. The 69 deaths from diphtheria included 49 in London, 4 in Cardiff, 3 in West Ham, and 3 in Birmingham. No death from small-pox was registered in any of the thirty-three towns.

### LONDON.

In LONDON† 2537 BIRTHS and 1238 DEATHS were registered. Allowing for increase of population, the births were 51, and the deaths 140, below the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hespital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far at Wandsworth, and in the scaluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 16·1, 15·4, and 14·8 in the preceding three weeks, further fell last week to 14·6. During the four weeks ending on Saturday last the death-rate averaged 15·2 per 1000, being 1·4 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1238 deaths included 7 from measles, 11 from scarlet fever, 49 from diphtheria, 16 from whooping-cough, 24 from enteric fever, 54 from diarrhæa and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 161 deaths were referred to these diseases.

being 59 below the corrected average weekly number.

The deaths from measles, which had been 19, 24, and 12 in the preceding three weeks, further fell last week to 7, and were 9 below the corrected average; 2 cases belonged to Poplar sanitary area. The deaths from scarlet fever, which had been 16, 16, and 18 in the preceding three weeks, fell again last week to 11, and were 12 below the corrected average; 2 cases belonged to Poplar sanitary area. from diphtheria, which had been 32, 49, and 48 in the preceding three weeks, were 49 last week, exceeding the corrected average by 8; 8 cases belonged to Camberwell, 7 to Bermondsey, 5 to Islington, 4 to Chelsea, and 4 to Greenwich sanitary areas. The deaths from whooping-cough, which had been 26, 31, and 31 in the preceding three weeks, fell again last week to 16, and were exactly half of the corrected average. The fatal cases of enteric fever, which had been 12, 14, and 14 in the preceding three weeks, rose last week to 24, exceeding the corrected average by 8; 5 cases belonged to Islington, 2 to London City, and 2 to Lambeth sanitary areas. The deaths from diarrhea, which had been 92, 69, and 61 in the preceding three weeks, further fell last week to 54, and were 34 below the corrected average. Of the 54 deaths from diarrhea, 48 were of children under 5 years of age; 24 more deaths at this age-period were described as due to gastro-enteritis, and are included under the heading "Enteritis" in Table 4.

The deaths referred to diseases of the respiratory organs, which had been 149, 135, and 118 in the preceding three weeks, rose again last week to 152, but were 24

below the corrected average.

The deaths attributed directly to influenza numbered 3, having been 2, 2, and

3 in the preceding three weeks.

Different forms of violence caused 50 deaths, concerning all but 3 of which inquests were held. Of these 50 deaths, 4 were cases of suicide and 1 of homicide, while the remaining 45 were attributed to accident or negligence. Nine of these were referred to vehicles in the streets, 5 to drowning, 1 to the effects of chloroform administered for surgical purposes, and 6 (including 5 of infants under one year of age) to suffocation in bed.

### CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 7 cases of small-pox, 3805 of scarlet fever, 790 of diphtheria, and 142 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, not one case, against 6, 2, and 1; of scarlet fever, 453 cases, against 333, 484, and 316; of diphtheria, 103 cases, against 86, 131, and 133; and of enteric fever, 15 cases, against 24, 31, and 28.

# GREATER LONDON.

In Greater London 3485 births and 1600 deaths were registered, corresponding to annual rates of 29.4 and 13.5 per 1000 of the estimated population. In the Outer Ring, 3 deaths from measles, 5 from scarlet fever, 13 from diphtheria, 10 from whooping-cough, 7 from "fever," and 9 from diarrhea were registered. Six deaths from diphtheria and 5 from "fever" occurred in West Ham district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.57 inches, and that of the Thermometer 58°.2, the latter being 0°.9 above the week's average in the 50 years 1841-90. The direction of the wind was South-Westerly, the horizontal movement of the air being 23 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 20.9 hours. The measured rainfall amounted to 1.22 inches.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

numbers in this c	olumn ar	e the	ave	rage	we	ekiv	dea	th	s fo	the ten years	1886-95, rais	ed by 5.5	41 pe	r cer	nt. f	or i	nere	ease	ot	

numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of ion.

See cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of s not certified by a registered practitioner, the case is returned under the heading "no statement." evidence at inquests is often insufficient to enable the Croner to certify whether a violent death be the result of t, murder, manslaughter, or suicide. All such cases are classed under "accident."

TABLE 5. LONDON.*—POPULATION; BIRTHS; DEATHS from ALL CAUSES, and from SMALL-POX, MEAS SCARLET FEVER, DIPHTHERIA, WHOOPING-COUGH, FEVER, DIARRHGA, VIOLENCE, &c., registered in Sub-district during the Week ending Saturday, 19th September, 1896.

## WEEKLY RETURN

#### BIRTHS AND EATHS IN LONDON

#### THIRTY-TWO OTHER GREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 39. 1896. Vol. LVII.] Week ending Saturday, September 26. [Price  $1\frac{1}{3}d$ .

General Register Office, Somerset House, September 28th, 1896.

### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Thirty-three Great Towns of England and Wales corresponded to an annual rate of 15.3 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending		Meeks ending

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.1 in Halifax and Gateshead, and 2.6 in Hull; from scarlet fever, 1.1 in Oldham; from whooping-cough, 1.1 in Swansea, and 1.4 in Birkenhead; from "fever," 1.5 in Sunderland; and from diarrhea, 1.3 in Cardiff, in Liverpool, and in Bolton, 1.4 in Preston, and 1.8 in Wolverhampton. The 84 deaths from diphtheria included 61 in London, 7 in Birmingham, and 4 in Cardiff. No death from small-pox was registered in any of the thirty-three

### LONDON.

In London† 2316 BIRTHS and 1262 DEATHS were registered. Allowing for increase of population, the births were 304, and the deaths 185, below the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses. Hospitals, and Lunatic Asylums situated outsais Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong,

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 15·4, 14·8, and 14·6 in the preceding three weeks, rose again last week to 14·9. During the four weeks ending on Saturday last the death-rate averaged 14·9 per 1000, being 1·7 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1262 deaths included 8 from measles, 17 from searlet fever, 61 from diphtheria, 27 from whooping-cough, 21 from enteric fever, 33 from diarrhea and dysentery, 1 from cholera, and not one death from small-pox, from typhus, or from any ill-defined form of continued fever; thus, 168 deaths were referred to these

diseases, being 46 below the corrected average weekly number.

The deaths from measles, which had been 24, 12, and 7 in the preceding three weeks, were 8 last week, and were 10 below the corrected average. The deaths from scarlet fever, which had been 16, 18, and 11 in the preceding three weeks, rose again to 17 last week, the corrected average being 26; 3 cases belonged to Hackney sanitary area. The deaths from diphtheria, which had been 49, 48, and 49 in the preceding three weeks, further rose to 61 last week, and were 13 above the corrected average; 7 cases belonged to Mile End Old Town, 6 to Camberwell, 6 to Greenwich, 4 to Islington, and 4 to St. Pancras sanitary areas. The deaths from whooping-cough, which had been 31, 31, and 16 in the preceding three weeks, rose again to 27 last week, exceeding the corrected average by 4; 4 cases belonged to St. Pancras, 3 to Bermondsey, and 3 to Greenwich sanitary areas. The fatal cases of enteric fever, which had been 14, 14, and 24 in the preceding three weeks, declined to 21 last week, but were 4 above the corrected average; 2 cases belonged to St. Pancras and 2 to Camberwell sanitary areas. The deaths from diarrhæa, which had been 69, 61, and 54 in the preceding three weeks, further fell last week to 33, and were 47 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 135, 118, and 152 in the preceding three weeks, further rose last week to 166, but were

41 below the corrected average.

The deaths attributed directly to influenza numbered 2, having been 2, 3, and

3 in the preceding three weeks.

Different forms of violence caused 58 deaths, concerning all of which inquests were held. Of these 58 deaths, 10 were cases of suicide, while the remaining 48 were attributed to accident or negligence. Two of these were referred to vehicles in the streets, 8 to burns and scalds, 4 to drowning, and 10 (of infants under one year of age) to suffocation in bed.

## CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 6 cases of small-pox, 3951 of scarlet fever, 778 of diphtheria, and 149 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 1 case, against 2, 1, and 0; of scarlet fever, 465 cases, against 484, 316, and 453; of diphtheria, 101 cases, against 131, 133, and 103; and of enteric fever, 24 cases, against 31, 28, and 15.

# GREATER LONDON.

In Greater London 3199 births and 1602 deaths were registered, corresponding to annual rates of 27.0 and 13.5 per 1000 of the estimated population. In the Outer Ring, 3 deaths from measles, 8 from scarlet fever, 9 from diphtheria, 9 from whooping-cough, 6 from "fever," and 6 from diarrhæa were registered. Three deaths from scarlet fever occurred in Brentford district and 3 in West Ham district; 2 deaths from diphtheria occurred in Croydon district, 2 in West Ham district, and 2 in Barnet sub-district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.37 inches, and that of the Thermometer 52°.9, the latter being 2°.4 below the week's average in the 50 years 1841-90. The direction of the wind was Westerly, the horizontal movement of the air being 66 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 20.1 hours. The measured rainfall amounted to 1.40 inches.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scartet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

tion.

is numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5 341 per cent. for increase of tion.

when the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of is not certified by a registered practitioner, the case is returned under the heading "no statement."

the evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of int, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Mex Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in Sub-district during the Week ending Saturday, 26th September, 1896.

	General Direction.	A.M.	ARE CARE	WSW & SW		-	W.	SW.S. &		WSW.&	18	The results apply to the civil day, or from midnight to midnight.	The fleight of the existent of the buroneter is 189 feet above the mean level of the sea; no correction has been applied to the readings to reduce the sea level.  Observations are usually taken at 9th. A.M.; noon; 3h. P.M.; and 9h. P.M. The means of the ever-readings of the baroneter, the dry bulb thermoneter, and the wet bulb thermoneter, are converted into mean daily values by the application of corrections deduced from a discussion of the photographic records made during the twenty vears ending 1873 for the baroneter, and	during the twenty years ending 1868 for the thermometers. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum and minimum thermometers, forming the mean daily while of the empendence of the air column 8). The mean daily day rount temperature and degree of humbility are deduced.	from the mean daily values of the dry and wet bulb thermometer metrical Tables.	The aversage temperature of the air is that derived from a discussion of the observations made at Greenwich during the 50 years ending 1890, and that of horizontal movement of the air from a discussion of the anemometric records for the 16 years ending 1875.  In reading the columns 9 and 24 it will be borne in mind that + is read "histoter," and	"lower," than the average. The values given in coolunn 17 are not corrected for the index error of the thermometer, hich cannot be determined.	The record of Electricity is derived from Thomson's self-registering Instrument, symbols employed are:—P. positive; N. negative; w. weak; m. moderate; s. strong; v. variable	The numbers in column 28, derived from the Campbell-Stokes Sunshine Instrument, show the agreement of unrigin or Dright sunshine on each day.  The reading of the parometer decreased from 29°58 in at the beginning of the week to 20°49 in.	by 3h. P.M. on the 20th; increased to 29'68 in. by 7h. A.M. on the 21st; decreased to 28'94 in. by 4h. A.M. on the 24th; decreased to 29'75 in. by 9h. A.M. on the 24th; decreased to 28'76 in. by 9h. A.M. on the 25th; decreased to 28'76 in. by the end of the week.

## WEEKLY RETURN

#### LONDON BIRTHS AND DEATHS

#### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HABDING ST., FETTER LANE, E.C.

No. 40, 1896, Vol. LVII. WEEK ENDING SATURDAY, OCTOBER 3. [Price 1 d.

> General Register Office, Somerset House, October 5th, 1896.

### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 15.7 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:—

	Weeks ending		Weeks ending

Leeds -	14.4 15.7 13.7 17.4		12.7   15.7   12.7   20.5
	11.8 10.5 13.4 10.0		

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·0 in Derby, 1·4 in Hull, and 3·2 in Gateshead; from whooping-cough, 1·1 in Swansea; and from diarrhæa, 1·2 in Plymouth and in Wolverhampton, 1·3 in Liverpool, and 2·3 in Preston. In no case did the death-rate from scarlet fever or from "fever" reach 1·0 per 1000 in any of the thirty-three towns. The 99 deaths from diphtheria included 69 in London 7 in thirty-three towns. The 99 deaths from diphtheria included 69 in London, 7 in West Ham, 5 in Liverpool, and 3 in Cardiff. No death from small-pox was registered in any of the thirty-three towns.

### LONDON.

In London 2844 BIRTHS and 1276 DEATHS were registered. Allowing for increase of population, the births were 215 above, and the deaths 162 below, the average numbers in the corresponding weeks of the last ten years. The annual death-rate

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

per 1000 from all causes, which had been 14.8, 14.6, and 14.9 in the preceding three weeks, further rose last week to 15.0. During the four weeks ending on Saturday last the death-rate averaged 14.8 per 1000, being 1.8 per 1000 below the mean rate in the corresponding of the first state of the corresponding of the same state.

rate in the corresponding periods of the ten years 1886-95.

The 1276 deaths included 7 from measles, 27 from scarlet fever, 69 from diphtheria, 9 from whooping-cough, 13 from enteric fever, 39 from diarrheea and dysentery, 1 from cholera, and not one death from small-pox, from typhus, or from any ill-defined form of continued fever; thus, 165 deaths were referred to these

diseases, being 29 below the corrected average weekly number.

The deaths from measles, which had been 12, 7, and 8 in the preceding three weeks, were 7 last week, the corrected average being 20. The deaths from scarlet fever, which had been 18, 11, and 17 in the preceding three weeks, further rose last week to 27, the corrected average being 26; 4 cases belonged to Mile End Old Town, 4 to Lambeth, and 3 to Shoreditch sanitary areas. The deaths from diphtheria, which had been 48, 49, and 61 in the preceding three weeks, further rose last week to 69, exceeding the corrected average by 24; 9 cases belonged to Camberwell, 6 to Lewisham, 5 to Islington, 5 to Clerkenwell, 4 to Chelsea, 4 to Westminster, and 4 to Greenwich sanitary areas. The deaths from whooping-cough, which had been 31, 16, and 27 in the preceding three weeks, fell again last week to 9, and were 11 below the corrected average. The fatal cases of enteric fever, which had been 14, 24, and 21 in the preceding three weeks, further fell last week to 13, and were 4 below the corrected average; 2 cases belonged to Bethnal Green, 2 to Newington, and 2 to Battersea sanitary areas. The deaths from diarrhea, which had been 61, 54, and 33 in the preceding three weeks, rose again last week to 39, but were 25 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 118, 152, and 166 in the preceding three weeks, further rose last week to 172, but were

57 below the corrected average.

The deaths attributed directly to influenza numbered 4, having been 3, 3, and

2 in the preceding three weeks.

Different forms of violence caused 57 deaths, concerning all but 1 of which inquests were held. Of these 57 deaths, 7 were cases of suicide, and 1 of homicide, while the remaining 49 were attributed to accident or negligence. Four of these were referred to vehicles in the streets, 3 to drowning, and 19 (of infants under one year of age) to suffication in bed.

## CASES OF INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 3 cases of small-pox, 4020 of scarlet fever, 787 of diphtheria, and 144 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, not one case, against 1, 0, and 1; of scarlet fever, 454 cases, against 316, 453, and 466; of diphtheria, 98 cases, against 133, 103, and 101; and of enteric fever, 19 cases, against 28, 15, and 24.

### GREATER LONDON.

In Greater London 3884 births and 1647 deaths were registered, corresponding to annual rates of 32.8 and 13.9 per 1000 of the estimated population. In the Outer Ring, 3 deaths from scarlet fever, 14 from diphtheria, 9 from whooping-cough, 6 from "fever," and 9 from diarrheea were registered. Nine deaths from diphtheria and 3 from "fever" occurred in West Ham district; 3 deaths from diphtheria occurred in Barking Town sub-district, and 3 from whooping-cough in Tottenham sub-district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.93 inches, and that of the Thermometer 53°.2, the latter being 1°.1 below the week's average in the 50 years 1841-90. The direction of the wind was South-Westerly, the horizontal movement of the air being 14 per cent. below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 16.8 hours. The measured rainfall amounted to 0.15 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

ne numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of stion.

10se cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical when the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of is not certified by a registered practitioner, the case is returned under the heading "no statement." are evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of int, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-Pox, Measl Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhæa, Violence, &c., registered in each Sub-district during the Week ending Saturday, 3rd October, 1896.

OF

# BIRTHS AND DEATHS IN LONDON

AND IN

## THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office,
AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 41. 1896. Vol. LVII.] WEEK ENDING SATURDAY, OCTOBER 10. [Price 1 d.

General Register Office, Somerset House, October 12th, 1896.

### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 16.7 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:—

		Weeks	ending	5				Weeks	ending	5

Leicester -	10.5	13.4	10.0	12.3						

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.0 in Derby, 1.1 in Halifax, 1.2 in Sheffield, 1.6 in Gateshead, 1.7 in Hull, and 1.8 in Nottingham; from scarlet fever, 1.4 in Birkenhead; from "fever", 1.1 in Sunderland; and from diarrhæa, 1.1 in Swansea and in Sunderland, 1.5 in Salford, and 2.0 in Blackburn. In no case did the death-rate from whooping-cough reach 1.0 per 1000 in any of the thirty-three towns. The 82 deaths from diphiheria included 52 in London, 6 in Birmingham, 5 in Liverpool, 4 in West Ham, and 3 in Salford. No death from small-pox was registered in any of the thirty-three towns.

A 93941.-2. 650.-10/96. Wt. 124.

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

### LONDON.

In London* 2536 births and 1378 deaths were registered. Allowing for increase of population, the births were 82, and the deaths 86, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 14.6, 14.9, and 15.0 in the preceding three weeks, further rose last week to 16.2. During the four weeks ending on Saturday last the death-rate averaged 15.2 per 1000, being 1.7 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1378 deaths included 14 from measles, 24 from scarlet fever, 52 from tiphtheria 19 from whooping-cough, 18 from enteric fever, 29 from diarrhee and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 156 deaths were referred to these

diseases, being 32 below the corrected average weekly number.

The deaths from measles, which had been 7, 8, and 7 in the preceding three weeks, rose last week to 14, but were 12 below the corrected average. The deaths from scarlet fever, which had been 11, 17, and 27 in the preceding three weeks, fell again last week to 24, and were 3 below the corrected average; 3 cases belonged to Islington sanitary area. The deaths from diphtheria, which had been 49, 61, and 69 in the preceding three weeks, fell again last week to 52, but were 9 above the corrected average; 6 cases belonged to Lewisham, 5 to Camberwell, 4 to Lambeth, 4 to Greenwich, 3 to Shoreditch, and 3 to Poplar sanitary areas. The deaths from whooping-cough, which had been 16, 27, and 9 in the preceding three weeks, rose again last week to 19, which is also the corrected average. The fatal cases of enteric fever, which had been 24, 21, and 13 in the preceding three weeks, rose again last week to 18, but were 2 below the corrected average; 3 cases belonged to Greenwich, 2 to St. Paneras, 2 to Hackney, and 2 to Newington sanitary areas. The deaths from diarrhæa, which had been 54, 33, and 39 in the preceding three weeks, fell again last week to 29, and were 22 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 152, 166, and 172 in the preceding three weeks, further rose last week to 218, but were

36 below the corrected average.

The deaths attributed directly to influenza numbered 3, having been 3, 2, and

4 in the preceding three weeks.

Different forms of violence caused 65 deaths, concerning all but 4 of which inquests were held. Of these 65 deaths, 7 were cases of suicide, 2 of homicide, and 1 of execution, while the remaining 55 were attributed to accident or negligence. Five of these were referred to vehicles in the streets, 7 to drowning, and 12 (of infants under one year of age) to suffocation in bed.

## Cases of Infectious Sickness in Hospitals.†

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 4 cases of small-pox, 4105 of scarlet fever, 798 of diphtheria, and 147 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 1 case, against 0, 1, and 0; of scarlet fever, 424 cases, against 453, 466, and 454; of diphtheria, 112 cases, against 103, 101, and 98; and of enteric fever, 25 cases, against 15, 24, and 19.

^{*} Including deaths of Londoners in the Metropolitan Workhouses. Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

[†] The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox. Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

### GREATER LONDON.

In Greater London 3469 births and 1725 deaths were registered, corresponding to annual rates of 29°3 and 14°6 per 1000 of the estimated population. In the Outer Ring, 9 deaths from diphtheria, 5 from whooping-cough, and 7 from "fever," were registered. Four deaths from diphtheria and 4 from "fever" occurred in West Ham district.

DEATHS BELONGING to the SEVERAL SANITARY AREAS OF REGISTRATION LONDON registered in the 13 weeks ending on 26th September, 1896.

In the above Table all deaths of persons in, or on the way to, Hospitals and other Public Institutions, as well as those of persons under treatment in surgical homes, or dying by accident or otherwise in the streets, have been distributed, as far as practicable, to the santary areas in which the deceased had previously resided. The deaths of 365 London residents who died outside Registration London in the Islington Union Workhouse, Bowes Manor, the Strand Union Workhouse at Edmonton, the Holborn Union Workhouse at Mitcham, the City of London Lunatic Asylum at Stone, and the Metropolitan Hospitals and Asylums have been similarly distributed. In 460 cases the previous residence was outside Registration London, and these have been excluded from the Table,

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.50 inches, and that of the Thermometer 52°.4, the latter being 0°.1 above the week's average in the 50 years 1841-90. The direction of the wind was South-Westerly, the horizontal movement of the air being 72 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 22.0 hours. The measured rainfall amounted to 1.02 inches.

### RETURNS OF LONDON WATER COMPANIES.

The LONDON WATER COMPANIES have been good enough to furnish the following account of the number of services and the average daily amount of water supplied during the month of September. The supply was in the ratio of 233 gallons to one service.

Note.—The Return for September 1896, as compared with that for the corresponding month of 1895, shows an increase of 13,900 services and a decrease of 31,667,473 gallons of water supplied daily.

## Analysis of Metropolitan Water Supply during September, 1896.

Water-analysis Laboratory, The Yews, Reigate, 5th October, 1896.

I HAVE to report to you the results of the chemical analysis, and of the physical and bacterioscopic examination, of the waters supplied to the inner, and portions of the outer, circle

of the Metropolis during the month of September.

At the request of the Associated Metropolitan Water Companies, I have extended these monthly examinations to (a) the chemical and bacterioscopic condition of the raw river water at the intakes of the various Companies, and (b) to the bacteriology of the water as it issues from the

filter beds of each Company, and before it is pumped into the distributing mains.

I append, also, the results obtained in the analyses of the waters supplied to Birmingham and Glasgow by their respective Corporations. These analyses were made by Dr. Hill of Birmingham and Dr. Mills of Glasgow.

Taking the average amount of organic impurity in a given volume of the Kent Company's water during the nine years ending December 1876 as unity, the proportional amount contained in an equal volume of water supplied by each of the Metropolitan Water Companies and by the Tottenham Urban District Council, was:—Kent 0.6, New River 1.0, East London (deepwell) 1.2, West Tottenham 1.3, West Middlesex 2.0, Chelsea and East London (river supply) 2.2, Grand Junction and Lambeth 2.4, Colne Valley 2.8, and Southwark 2.9, The unfiltered river waters contained the following proportions:—Thames at Hampton 4.9, New River Cut 2.6, and the Lea at Angel Road 6.5.

The Thames at Hampton was, on September 9th, turbid and yellow in colour. It was of moderate chemical, but bad bacterial quality. After storage for 12 days by the Chelsea Company, the number of microbes per c.c. was reduced to less than one-thirtieth of that found in the raw Thames water on the same day. As delivered by the Chelsea, West Middlesex, Southwark, Grand Junction, and Lambeth Companies it was in every case efficiently filtered. All the Thames-derived waters were of excellent chemical quality for dietetic use; and, with one exception, also of excellent bacterial quality. The sample of the Southwark Company's water drawn from No. 4

filter well was absolutely sterile by the gelatine-peptone test. The bacterial improvement effected by the various Companies is expressed by the following percentage numbers:—Chelsea 99.95, West Middlesex 99.68, Southwark (No. 4 filter) 100, (No. 8 filter) 98.42, Grand Junction (general well at Hampton) 97.21, (general well at Kew) 99.86, and Lambeth 99.30.

The New River Cut, before entering the subsidence and storage reservoir, was, on September 11th, turbid and very pale yellow in colour. It was of excellent chemical, but somewhat inferior bacterial, quality. After efficient filtration this water was delivered from the general filter well in most excellent chemical and bacterial condition, excelling, as regards organic purity, the most of the deep-well waters. At the time the sample was taken, the water issuing from No. 2 filter well was absolutely sterile by Koch's gelatine-plate test. The bacterial improvement effected by this Company is expressed by the following percentage numbers:—general filter well 99·53, No. 2 filter well 100, No. 4 filter well 99·21. The water taken from the Lea at Angel Road by the East London Company on September 11th was turbid and deep yellow in colour. It was of bad chemical and very bad bacterial quality; but, after efficient filtration, it was delivered in excellent chemical and bacterial condition, the bacterial improvement amounting to the following percentage numbers:—No. 1 Essex well 99·89, and No. 2 Essex well 99·85.

The deep-well waters of the Kent and East London Companies, and of the Tottenham Urban District Council were of excellent chemical quality, but the Colne Valley Company's water contained, for deep-well water, rather a large proportion of organic matter. The Tottenham and East London waters were very slightly turbid from suspended particles of oxide of iron and chalk. The other deep-well waters were bright, and that sent out by the Colne Valley Company was softened before delivery.

Seen through a stratum two feet deep, the Kent and Colne Valley waters were clear and colourless, the Tottenham and East London (deep well) very slightly turbid and colourless, the New River clear and nearly colourless, and the remaining waters clear and very pale yellow.

The bacterioscopic examination of the raw river waters, before and after storage, and of the supplies delivered by the various Companies and collected on the 9th, 10th, 11th, and 12th of September, yielded the results contained in the following table:—

Description.	Microbes per c.c.	Temp. C.
RAW AND STORED RIVER WATERS.		
Thames at Hampton, September 9th  after storage for 13 days (Chelsea Company), September 9th  West Middlesex Company's water passing on to filters 1-5, September 10th Grand Junction  arriving at Kew from Hampton, September 10th.  at Kew passing on to filters 2-6, September 10th. Dr. Hill, F.I.C., Medical Officer of Health for Birmingham, reports that the water supplied to that city was "very slightly turbid and pale green in a two-foot tube."

Dr. Mills, F.R.S., of the Glasgow and West of Scotland Technical College, reports that the water supplied to that city from Loch Katrine was "light brown in colour, and contained a "little suspended matter."

I am, &c. E. Frankland.

* Analysed by Dr. Alfred Hill, F.I.C., Medical Officer of Health and Analyst to the City. † Analysed by Dr. E. J. Mills, F.R.S., of the Glasgow and West of Scotland Technical College.

All the numbers in columns 4, 5, 6, 7, 8, 9, 10, and 11, relate to 100,000 parts of the waters. The Table is to be read thus:—the Thames water at the Grand Junction Company's intake at Hampton, collected on the 9th of September 1896, had a temperature of 18.0° C.; 100,000 lbs. of it contained 26.44 lbs. of solid matter; the organic-substances, constituting a portion of this matter, contained .247 lb. of carbon and .044 lb. of nitrogen. The above quantity of water also contained .004 lb. of ammonia and .127 lb. of nitrogen in the form of nitrates and nitrites, whilst the total amount of combined nitrogen in every form was .174 lb. The above weight of water also contained 1.9 lb. of chlorine, and 17.1 lbs. of carbonate of lime, or an equivalent amount of other soap-destroying or hardening ingredients.

of other soap-destroying or hardening ingredients.

The numbers in the analytical Table can be converted into grains per imperial gallon by multiplying them by 7, and then moving the decimal point one place to the left. The same operation transforms the hardness in the Table into degrees of hardness on Clark's scale.

### WEEKLY RETURN

#### AND DEATHS IN LONDON BIRTHS

AND IN

## THIRTY-TWO OTHER GREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office,

AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST. FETTER LANE, E.C.

WEEK ENDING SATURDAY, OCTOBER 17. [Price 1 1 d. No. 42. 1896. Vol. LVII.]

> General Register Office, Somerset House, October 19th, 1896.

THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Towns of England and Wales corresponded to an ann .ate of 16.3 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending			1	Weeks	ending

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.9 in Hull, 2.6 in Gateshead, and 2.9 in Plymouth; from scarlet fever, 1.0 in Birkenhead; from whooping-cough, 1.1 in Swansea; from "fever", 1.9 in Sunderland; and from diarrhæa, 1.0 in Liverpool, 1.1 in Oldham, 1.2 in Blackburn, and 1.8 in Preston. The 92 deaths from diphtheria included 66 in London, 6 in west Ham, and 3 in Birmingham. No death from small-pox was registered in any of the thirty-three towns.

### LONDON.

In London† 2516 BIRTHS and 1333 DEATHS were registered. Allowing for increase of population, the births were 156, and the deaths 254, below the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as Practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

A 93941.—3. 650.—10/96. Wt. 124,

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 14.9, 15.0, and 16.2 in the preceding three weeks, fell again last week to 15.7. During the four weeks ending on Saturday last the death-rate averaged 15.5 per 1000, being 2.0 per 1000 below the mean rate in the corresponding periods of the ten years 1886–95.

The 1333 deaths included 9 from measles, 16 from scarlet fever, 66 from diphtheria, 15 from whooping-cough, 17 from enteric fever, 1 from an ill-defined form of continued fever, 14 from diarrhea and dysentery, and not one death from small-pox, from typhus, or from cholera; thus, 138 deaths were referred to these

diseases, being 60 below the corrected average weekly number.

The deaths from measles, which had been 8, 7, and 14 in the preceding three weeks, fell again last week to 9, and were 25 below the corrected average; 2 cases belonged to Limehouse sanitary area. The deaths from scarlet fever, which had been 17, 27, and 24 in the preceding three weeks, further fell last week to 16, and were 13 below the corrected average; 3 cases belonged to Hackney sanitary area. The deaths from diphtheria, which had been 61, 69, and 52 in the preceding three weeks, rose again last week to 66, and were 18 above the corrected average; 10 cases belonged to Camberwell, 9 to Lewisham, 6 to Islington, 4 to Hackney, and 4 to Newington sanitary areas. The deaths from whooping-cough, which had been 27, 9, and 19 in the preceding three weeks, fell again last week to 15, and were 8 below the corrected average. The fatal cases of enteric fever, which had been 21, 13, and 18 in the preceding three weeks, were 17 last week, the corrected average being 18; 3 cases belonged to Islington, 3 to Greenwich, and 2 to Bethnal Green sanitary areas. The deaths from diarrhea, which had been 33, 39, and 29 in the preceding three weeks, further fell last week to 14, and were 29 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 166, 172, and 218 in the preceding three weeks, further rose last week to 238, but were

76 below the corrected average.

The deaths attributed directly to influenza numbered 4, having been 2, 4, and

3 in the preceding three weeks.

Different forms of violence caused 65 deaths, concerning all but 3 of which inquests were held. Of these 65 deaths, 6 were cases of suicide, and 2 of homicide, while the remaining 57 were attributed to accident or negligence. Six of these were referred to vehicles in the streets, 10 to drowning, and 12 (including 11 of infants under one year of age) to suffocation in bed.

Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 2 cases of small-pox, 4073 of scarlet fever, 803 of diphtheria, and 145 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, not one case, against 1, 0, and 1; of scarlet fever, 372 cases, against 466, 454, and 424; of diphtheria, 105 cases, against 101, 98, and 112; and of enteric fever, 13 cases, against 24, 19, and 25.

GREATER LONDON.

In Greater London 3434 births and 1678 deaths were registered, corresponding to annual rates of 29.0 and 14.2 per 1000 of the estimated population. In the Outer Ring, 6 deaths from scarlet fever, 21 from diphtheria, 4 from whooping-cough, 9 from "fever," and 5 from diarrhea were registered. Two deaths from scarlet fever, 7 from diphtheria, and 3 from "fever" occurred in West Ham district; 2 deaths from scarlet fever occurred in Willesden district, and 3 deaths from diphtheria in Tottenham sub-district.

METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.77 inches, and that of the Thermometer 46.9, the latter being 3.3 below the week's average in the 50 years 1841-90. The direction of the wind was North-Easterly, the horizontal movement of the air being 40 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 4.8 hours. The measured rainfall amounted to 1.15 inches.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scartet Pever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of pulation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical n. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of this not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of ident, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-Pox, Measler Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in each Sub-district during the Week ending Saturday, 17th October, 1896.

# WEEKLY RETURN

#### BIRTHS AND DEATHS IN LONDON

AND IN

## THIRTY-TWO OTHER GREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST. FETTER LANE, E.C.

WEEK ENDING SATURDAY, OCTOBER 24. [Price  $1\frac{1}{2}d$ . No. 43. 1896. Vol. LVII.

> General Register Office, Somerset House, October 26th, 1896.

### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 17.6 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending	g.			Weeks	ending

The highest annual death-rates per 1000 living, as measured by last week's mortality, were :- from measles, 1.1 in Nottingham and in Bradford, 1.2 in Hull, and 2.3 in Plymouth; from scarlet fever, 1.0 in Birkenhead; from whooping-cough, 1.0 in Cardiff and in Huddersfield, and 1.1 in Swansea; and from diarrhæa, 1.0 in Birkenhead and in Burnley, 1.1 in Gateshead, and 1.7 in Bolton. In no case did the death-rate from "fever" reach 1.0 per 1000 in any of the thirty-three towns. The 89 deaths from diphtheria included 57 in London, 6 in West Ham, 5 in Leicester, 5 in Liverpool, 3 in Bristol, and 3 in Birmingham. No death from small-pox was registered in any of the thirty-three towns.

### LONDON.

In LONDON 7 2755 BIRTHS and 1450 DEATHS were registered. Allowing for increase of population, the births were 75 above, and the deaths 145 below, the average

^{*}By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated cutside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesse County Lunatic Asylums at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far at Wandsworth, and in the scaluded from Registration London are for the purposes of Tables 1, 6, and 7, a ded to the Outer Ring, or to other areas to which they belong.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 15·0, 16·2, and 15·7 in the preceding three weeks, rose again last week to 17·1. During the four weeks ending on Saturday last the death-rate averaged 16·0 per 1000, being 1·9 per 1000 below the mean rate in the corresponding periods of the ten years 1886–95.

The 1450 deaths included 10 from measles, 15 from scarlet fever, 57 from diphtheria, 14 from whooping-cough, 9 from enteric fever, 1 from an ill-defined form of continued fever, 14 from diarrhæa and dysentery, and not one death from small-pox, from typhus, or from cholera; thus, 120 deaths were referred to these

diseases, being 69 below the corrected average weekly number.

The deaths from measles, which had been 7, 14, and 9 in the preceding three weeks, were 10 last week, the corrected average being 39. The deaths from scarlet fever, which had been 27, 24, and 16 in the preceding three weeks, were 15 last week, the corrected average being 30. The deaths from diphtheria, which had been 69, 52, and 66 in the preceding three weeks, fell again last week to 57, but were 12 above the corrected average; 8 cases belonged to Islington, 8 to Camberwell, 5 to St. Pancras, and 4 to Lambeth sanitary areas. The deaths from whooping-cough, which had been 9, 19, and 15 in the preceding three weeks, were 14 last week, the corrected average being 23. The fatal cases of enteric fever, which had been 13, 18, and 17 in the preceding three weeks, fell again last week to 9, and were 10 below the corrected average; 2 cases belonged to Fulham and 2 to St. Pancras sanitary areas. The deaths from diarrhæa, which had been 39, 29, and 14 in the preceding three weeks, were again 14 last week, the corrected average being 30.

The deaths referred to diseases of the respiratory organs, which had been 172, 218, and 238 in the preceding three weeks, further rose last week to 334, but were

25 below the corrected average.

The deaths attributed directly to influenza numbered 7, having been 4, 3, and

4 in the preceding three weeks.

Different forms of violence caused 62 deaths, concerning all but 2 of which inquests were held. Of these 62 deaths, 9 were cases of suicide, and 2 of homicide, while the remaining 51 were attributed to accident or negligence. Nine of these were referred to vehicles in the streets, and 13 (including 12 of infants under one year of age) to suffocation in bed.

### Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 1 case of small-pox, 4164 of scarlet fever, 799 of diphtheria, and 133 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, not one case, against 0, 1, and 0; of scarlet fever, 448 cases, against 454, 424, and 372; of diphtheria, 105 cases, against 98, 112, and 105; and of enteric fever, 18 cases, against 19, 25, and 13.

### GREATER LONDON.

In Greater London 3763 births and 1825 deaths were registered, corresponding to annual rates of 31.8 and 15.4 per 1000 of the estimated population. In the Outer Ring, 6 deaths from scarlet fever, 10 from diphtheria, and 12 from "fever," were registered. Seven deaths from diphtheria and 4 from "fever" occurred in West Ham district; 3 deaths from scarlet fever and 2 from "fever" occurred in Edmonton district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.33 inches, and that of the Thermometer 42°·1, the latter being 6°·6 below the week's average in the 50 years 1841-99. The direction of the wind was variable, the horizontal movement of the air being 0·3 per centabove the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 9·5 hours. The measured rainfall amounted to 0·41 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scartet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

### WEEK RETURN

#### BIRTHS AND DEATHS IN LONDON

AND IN

## THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST. FETTER LANE, E.C.

No. 44, 1896. Vol. LVII.] WEEK ENDING SATURDAY, OCTOBER 31. [Price 11/2d.

> General Register Office, Somerset House, November 2nd, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 19.7 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending	3 7	In the second	1	Weeks	ending	3
Towns.	Oct. 10.	Oct. 17.	Oct. 24.	Oct. 31.	Towns.	Oct. 10.	Oct. 17.		Oct. 31.

Croydon -	11.5	9.7	11.5	13.3	Preston -	17.9	17.9	23:4	22.9
	15.4	14.3	18.4	12.8	Salford	21.0	16.6	22.8	17.6
Gateshead -	14.8	15.9	16.4	18.0	Sheffield	18.8	21.8	19.1	18.6
Halifax -	16.5	18.7	16.0	19.3	Sunderland -	21.5	18.9	17.5	17.1
Huddersfield	13.5	11.9	14.0	15.1			12.2		
Hull -	21.0	19.8	21.2	19.4			13:4		
Leeds -	17.1			19.7	Wolverhampton -	18.1	11.4	19.9	23.5
Leicester -	12.3	9.4	15:0	17.1					

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.1 in Bradford, 1.3 in Brighton, 1.4 in Nottingham and in Manchester, 2.1 in Gateshead, and 2.9 in Plymouth; from scarlet fever, 1.0 in Derby and 1.1 in Gateshead; from whooping-cough, 1.1 in Not tingham; from "fever", 1.7 in Bolton; and from diarrhea, 1.0 in Derby and 1.2 in Wolverhampton. The 95 deaths from diphtheria included 64 in London, 7 in Liverpool, 6 in West Ham, and 3 in Sheffield. No death from small-pox was registered in any of the thirty-three towns.

### LONDON.

In London† 2819 BIRTHS and 1709 DEATHS were registered. Allowing for increase of population, the births were 104, and the deaths 62, above the average numbers in the corresponding weeks of the last ten years. The annual death-rate

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses. Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate anall-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Beard Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

per 1000 from all causes, which had been 16.2, 15.7, and 17.1 in the preceding three weeks, further rose last week to 20.2. During the four weeks ending on Saturday last the death-rate averaged 17.3 per 1000, being 1.2 per 1000 below the mean

rate in the corresponding periods of the ten years 1886-95.

The 1709 deaths included 12 from measles, 11 from scarlet fever, 64 from diphtheria, 19 from whooping-cough, 1 from typhus, 27 from enteric fever, 13 from diarrhœa and dysentery, and not one death from small-pox, from any ill-defined form of continued fever, or from cholera; thus, 147 deaths were referred to these diseases, being 48 below the corrected average weekly number.

The deaths from measles, which had been 14, 9, and 10 in the preceding three weeks, further rose last week to 12, but were 35 below the corrected average; 3 cases belonged to Limehouse sanitary area. The deaths from scarlet fever, which had been 24, 16, and 15 in the preceding three weeks, further fell last week to 11, and were 18 below the corrected average; 3 cases belonged to Whitechapel sanitary area. The deaths from diphtheria, which had been 52, 66, and 57 in the preceding three weeks, rose again last week to 64, and were 20 above the corrected average; 10 cases belonged to Camberwell, 6 to Islington, 5 to Chelsea, 5 to Poplar, 4 to Hackney, 4 to Shoreditch, 4 to Lambeth, 3 to Wandsworth, and 3 to Lewisham sanitary areas. The deaths from whooping-cough, which had been 19, 15, and 14 in the preceding three weeks, rose again last week to 19, but were 4 below the corrected average; 4 cases belonged to Greenwich and 3 to Plumstead sanitary areas. The fatal cases of enteric fever, which had been 18, 17, and 9 in the preceding three weeks, rose again last week to 27, exceeding the corrected average by 7; 3 cases belonged to Hackney and 2 to Stoke Newington sanitary areas. The death of a man, aged 55 years, in St. Ervan's Road, Kensington, was certified as due to typhus. The deaths from diarrhæa, which had been 29, 14, and 14 in the preceding three weeks, were 13 last week, the corrected average being 31.

The deaths referred to diseases of the respiratory organs, which had been 218, 238, and 334 in the preceding three weeks, further rose last week to 387, but were

4 below the corrected average.

The deaths attributed directly to influenza numbered 13, having been 3, 4, and

7 in the preceding three weeks.

Different forms of violence caused 74 deaths, concerning all but 2 of which inquests were held. Of these 74 deaths, 5 were cases of suicide, and 1 of homicide, while the remaining 68 were attributed to accident or negligence. Four of these were referred to vehicles in the streets, 1 to a conflagration, and 21 (of infants under one year of age) to suffocation in bed.

## CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 2 cases of small-pox, 4160 of scarlet fever, 793 of diphtheria, and 135 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 1 case, against 1, 0, and 0; of scarlet fever, 367 cases, against 424, 372, and 448; of diphtheria, 122 cases, against 112, 105, and 105; and of enteric fever, 21 cases, against 25, 13, and 18.

## GREATER LONDON.

In Greater London 3920 births and 2133 deaths were registered, corresponding to annual rates of 33·1 and 18·0 per 1000 of the estimated population. In the Outer Ring, 3 deaths from measles, 4 from scarlet fever, 14 from diphtheria, 4 from whooping-cough, 4 from "fever," and 5 from diarrheea were registered. Seven deaths from diphtheria and 3 from "fever" occurred in West Ham district.

## METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.46 inches, and that of the Thermometer 41° 6, the latter being 5° 6 below the week's average in the 50 years 1841–90. The direction of the wind was variable, the horizontal movement of the air being one per centabove the week's average in the 16 years 1860–75. The duration of registered bright sunshine in the week was 27.1 hours. The measured rainfall amounted to 0.21 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after solourn in the Hospital, to have been erroneous.

numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of ion.

se cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical when the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of not certified by a registered practitioner, the case is returned under the heading "no statement."

evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-Pox, Meas Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhoa, Violence, &c., registered in Sub-district during the Week ending Saturday, 31st October, 1896.

Osler's.	General Direction.	P.M.		WSW.&SW.	WSW. & SW.	W. WSW. &	WBW.	NE.	NE. & NNE.	ż	& NE.	19		The Pseulus apply to the civil day, or from midnight to midnight.  The height of the cistern of the barometer is 159 feet above the mean level of the sea; no correction has been applied to the readings to reduce the sea level.  Observations are usually taken at 8h. A.M.; noon; 3h. P.M.; and 9h. P.M. The means of the eye-readings of the barometer, the dry bulb thermometer; and the week bulb thermometer; and one were thulb thermometer; are converted into mean daily values by the application of corrections defined from a discussion.	of the photographic records made during the twenty years ending 1873 for the barometer, and during the twenty years ending 1885 for the barometers. With the corrected mean reading of the dry bulb thermometer so concerned mean reading of the dry bulb thermometer so conclude the acceptance of the way.	and minimum thermometers, forming the mean daily value of femperature of the air (column 8). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wee bulb thermometer by Ghaisher's Hygro-metrical Tables.	The average temperature of the air is that derived from a discussion of the observations made at Greenwich during the 50 years ending 1890, and that of broisontal movement of the air from a discussion of the amenometric records for the 16 years ending 1875.	In reading the columns 9 and 24 it will be borne in mind that + is read "higher," and "lover," than the average.  The Values given in column 17 are not corrected for the index server of the theoremsee.	which cannot be determined.  The record of Electricity is derived from Thomson's self-registering Instrument, symbols employed are:—P. positive; N. negative; w. weak; m. moderane a stronge.	Y. variable The numbers in column 28, derived from the Campbell-Stokes Sunshine Instrument, show the segregate duration of bright sunshine on each day.	The reading of the barometer decreased from 29.23 in, at the beginning of the week to 29.18 in, by noon on the 25th; increased to 29.68 in, by 1lh. P.M. on the 27th; decreased to 29.68 in, by 2h, A.M. on the 20th; decreased to 29.63 by 9h, A.M. on the 20th; to crease 4 to 29.54 by 9h, A.M. on the 20th; decreased 4 to 29.54 by 9h, A.M. on the 20th; decreased 4 to 29.55 by 9h, A.M. on the 20th; decreased 4 to 29.55 by 9h, A.M. on the 20th; decreased 4 to 20.54 in the 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of 20th of	reased to 29.5

# WEEKLY RETURN

#### BIRTHS AND DEATHS IN LONDON

AND IN

#### OTHER CREAT TOWNS. THIRTY-TWO

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office. AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST. FETTER LANE, E.C.

WEEK ENDING SATURDAY, NOVEMBER 7. [Price 1 d. o. 45. 1896. Vol. LVII.

> General Register Office, Somerset House. November 9th, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 20.6 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alpha betically arranged, corresponded to the following annual rates per 1000:-

17.   24.   31.   7.			Weeks	ending	1	N	and the second	4.	Weeks	ending

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·1 in Nottingham, 1·9 in Hull, 2·6 in Gateshead, and 4·0 in Plymouth; from scarlet fever, 1·1 in Oldham; from whooping-cough, 1·2 in Wolverhampton, 1·5 in Burnley, 1·6 in Huddersfield, and 2·1 in Swansea; from "fever", 1·1 in Halifax and 1·4 in Nottingham; and from diarrhæa, 1·0 in Derby, 1·1 in Sunderland, and 1·2 in Plymouth. The 79 deaths from diphtheria included 53 in London, 6 in West Ham, and 3 in Cardiff. No death from small-pox was registered in any of the thirty-three towns.

#### LONDON.

In London† 2736 BIRTHS and 1713 DEATHS were registered. Allowing for increase of population, the births were 41, and the deaths 75, above the average numbers in the corresponding weeks of the last ten years. The annual death-rate

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

per 1000 from all causes, which had been 15.7, 17.1, and 20.2 in the preceding three weeks, was again 20.2 last week. Düring the four weeks ending on Saturday last the death-rate averaged 18.3 per 1000, being 0.7 per 1000 below the mean

rate in the corresponding periods of the ten years 1886-95.

The 1713 deaths included 19 from measles, 18 from scarlet fever, 53 from diphtheria, 8 from whooping-cough, 15 from enteric fever, 13 from diarrheea and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 126 deaths were referred to these

diseases, being 66 below the corrected average weekly number.

The deaths from measles, which had been 9, 10, and 12 in the preceding three weeks, further rose last week to 19, but were 33 below the corrected average; 6 cases belonged to Limehouse, 5 to Greenwich, and 3 to Shoreditch sanitary areas. The deaths from scarlet fever, which had been 16, 15, and 11 in the preceding three weeks, rose again last week to 18, but were 10 below the corrected average. The deaths from diphtheria, which had been 66, 57, and 64 in the preceding three weeks, fell again last week to 53, but were 5 above the corrected average; 6 cases belonged to Camberwell, 5 to Islington, 5 to Hackney, 5 to Lambeth, and 5 to Lewisham sanitary areas. The deaths from whooping-cough, which had been 15, 14, and 19 in the preceding three weeks, fell again last week to 8, and were only one-third of the corrected average. The fatal cases of enteric fever, which had been 17, 9, and 27 in the preceding three weeks, fell again last week to 15, and were 4 below the corrected average; 2 cases belonged to St. Pancras, 2 to Bermondsey, and 2 to Greenwich sanitary areas. The deaths from diarrhea, which had been 14, 14, and 13 in the preceding three weeks, were again 13 last week, the corrected average being 19.

The deaths referred to diseases of the respiratory organs, which had been 238, 334, and 387 in the preceding three weeks, further rose last week to 440, and were

45 above the corrected average.

The deaths attributed directly to influenza numbered 15, having been 4, 7, and

13 in the preceding three weeks.

Different forms of violence caused 75 deaths, concerning all but 3 of which inquests were held. Of these 75 deaths, 6 were cases of suicide, while the remaining 69 were attributed to accident or negligence. Seven of these were referred to vehicles in the streets, 5 to a conflagration, 1 to the effects of chloroform administered for surgical purposes, and 17 (including 16 of infants under one year of age) to suffocation in bed.

## Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 2 cases of small-pox, 4137 of scarlet fever, 813 of diphtheria, and 142 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, not one case, against 0, 0, and 1; of scarlet fever, 384 cases, against 372, 448, and 367; of diphtheria, 115 cases, against 105, 105, and 122; and of enteric fever, 28 cases, against 13, 18, and 21.

#### GREATER LONDON.

In Greater London 3719 births and 2179 deaths were registered, corresponding to annual rates of 31.4 and 18.4 per 1000 of the estimated population. In the Outer Ring, 4 deaths from measles, 5 from scarlet fever, 16 from diphtheria, 4 from whooping-cough, 4 from "fever," and 6 from diarrhea were registered. Seven deaths from diphtheria occurred in West Ham district, and 3 from "fever" in Edmonton district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.92 inches, and that of the Thermometer 40°0, the latter being 6°0 below the week's average in the 50 years 1841-90. The direction of the wind was North-Easterly, the horizontal movement of the air being 16 per cent, below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 19.7 hours. The measured rainfall amounted to 0.42 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scariet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of the cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical then the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of not certified by a registered practitioner, the case is returned under the heading "no statement." evidence at inquests is often insufficient to enable the Corner to certify whether a violent death be the result of murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Meas Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in Sub-district during the Week ending Saturday, 7th November, 1896.

# WEEKLY RETURN

#### BIRTHS AND DEATHS IN LONDON

AND IN

# THIRTY-TWO OTHER GREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 46. 1896. Vol. LVII.] WEEK ENDING SATURDAY, NOVEMBER 14. [Price 1 ] d.

> General Register Office, Somerset House, November 16th, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Thirty-three Great Towns of England and Wales corresponded to an annual rate of 20.8 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

	Weeks ending			Weeks ending

Leicester ·	15.0 17.1 15.0 16.0			

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.0 in Newcastle-on-Tyne, 1.1 in Halifax, 1.3 in Manchester, 1.6 in Bradford, 1.7 in Hull, 2.0 in Nottingham, 2.6 in Gateshead, and 5.8 in Plymouth; from scarlet fever, 1.1 in Sunderland; from whooping-cough, 1.0 in Birkenhead, 1.1 in Swansea, and 1.6 in Blackburn and in Huddersfield; and from "fever", 1.0 in Birkenhead. In no case did the death-rate from diarrhea reach 1.0 per 1000 in any of the thirty-three towns. The 80 deaths from diphtheria included 60 in London and 5 in West Ham. No death from small-pox was registered in any of the thirty-three towns.

A 93941.-7. 650.-11/96. Wt. 124,

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

In London* 2675 births and 1675 deaths were registered. Allowing for increase of population, the births were exactly equal to, and the deaths 14 above, the average numbers in the corresponding weeks of the last ten years. death-rate per 1000 from all causes, which had been 17.1, 20.2, and 20.2 in the preceding three weeks, fell again last week to 19.8. During the four weeks ending on Saturday last the death-rate averaged 19:3 per 1000, being 0:1 per 1000 above the mean rate in the corresponding periods of the ten years 1886-95.

The 1675 deaths included 12 from measles, 21 from scarlet fever, 60 from diphtheria, 21 from whooping-cough, 17 from enteric fever, 7 from diarrhea and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 138 deaths were referred to these diseases, being 59 below the corrected average weekly number.

The deaths from measles, which had been 10, 12, and 19 in the preceding three weeks, fell again last week to 12, the corrected average being 53; 4 cases belonged to Limehouse sanitary area. The deaths from scarlet fever, which had been 15, 11, and 18 in the preceding three weeks, further rose last week to 21, but were 5 below the corrected average; 4 cases belonged to Greenwich and 3 to Kensington sanitary The deaths from diphtheria, which had been 57, 64, and 53 in the preceding three weeks, rose again last week to 60, and were 16 above the corrected average: 7 cases belonged to Islington, 6 to Poplar, 4 to Chelsea, 4 to Lambeth, 4 to Camberwell, 3 to Kensington, 3 to St. Marylebone, 3 to Hackney, and 3 to Wandsworth sanitary areas. The deaths from whooping-cough, which had been 14, 19, and 8 in the preceding three weeks, rose again last week to 21, but were 11 below the corrected average. The fatal cases of enteric fever, which had been 9, 27, and 15 in the preceding three weeks, rose again last week to 17, but were 3 below the corrected average; 2 cases belonged to Hackney, 2 to Poplar, and 2 to Lambeth sanitary areas. The deaths from diarrhea, which had been 14, 13, and 13 in the preceding three weeks, fell last week to 7, the corrected average being 20.

The deaths referred to diseases of the respiratory organs, which had been 334, 387, and 440 in the preceding three weeks, further rose last week to 492, and were 80 above the corrected average.

The deaths attributed directly to influenza numbered 10, having been 7, 13, and 15 in the preceding three weeks.

Different forms of violence caused 62 deaths, concerning all but 1 of which inquests were held. Of these 62 deaths, 2 were cases of suicide, and 2 of homicide, while the remaining 58 were attributed to accident or negligence. Four of these were referred to vehicles in the streets, 12 to burns and scalds, 1 to the effects of an anæsthetic administered for surgical purposes, and 16 (of infants under one year of age) to suffocation in bed.

## CASES of INFECTIOUS SICKNESS in HOSPITALS.†

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 2 cases of small-pox, 4134 of scarlet fever, 796 of diphtheria, and 141 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow: Of small-pox, not one case, against 0, 1, and 0; of scarlet fever, 362 cases, against 448, 367, and 384; of diphtheria, 108 cases, against 105, 122, and 115; and of enteric fever, 25 cases, against 18, 21, and 28.

^{*} Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylurg s situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Pever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

† The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

## GREATER LONDON.

In Greater London 3622 births and 2183 deaths were registered, corresponding to annual rates of 30.6 and 18.4 per 1000 of the estimated population. In the Outer Ring, 5 deaths from measles, 6 from scarlet fever, 12 from diphtheria, 13 from whooping-cough, 4 from "fever," and 2 from diarrhæa were registered. Three deaths from measles, 3 from scarlet fever, 6 from diphtheria, 3 from whooping-cough, and 2 from "fever" occurred in West Ham district; 3 deaths from diphtheria occurred in Willesden sub-district, and 3 from whooping-cough in Tottenham sub-district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.85 inches, and that of the Thermometer 42°·1, the latter being 1°·3 below the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 2 per cent. below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 7·7 hours. The measured rainfall amounted to 0·56 of an inch.

## RETURNS OF LONDON WATER COMPANIES.

The LONDON WATER COMPANIES have been good enough to furnish the following account of the number of services and the average daily amount of water supplied during the month of October. The supply was in the ratio of 237 gallons to one service.

COMPANIES.	Number o	f Services.		ly of Water lions.

Note.—The Return for October 1896, as compared with that for the corresponding month of 1895, shows an increase of 14,001 services and a decrease of 17,314,464 gallons of water supplied daily.

# Analysis of Metropolitan Water Supply during October, 1896.

Water-analysis Laboratory, The Yews, Reigate, 10th November, 1896.

SIR,

1 HAVE to report to you the results of the chemical analysis, and of the physical and bacterioscopic examination, of the waters supplied to the inner, and portions of the outer, circle

of the Metropolis during the month of October.

At the request of the Associated Metropolitan Water Companies, I have extended these monthly examinations to (a) the chemical and bacterioscopic condition of the raw river waters at the intakes of the various Companies, and (b) to the bacteriology of the water as it issues from the filter beds of each Company, and before it is pumped into the distributing mains.

I append, also, the results obtained in the analyses of the waters supplied to Birmingham and Glasgow by their respective Corporations. These analyses were made by Dr. Hill of Birmingham and Dr. Mills of Glasgow.

Taking the average amount of organic impurity in a given volume of the Kent Company's water during the nine years ending December 1876 as unity, the proportional amount contained in an equal volume of water supplied by each of the Metropolitan Water Companies and by the Tottenham Urban District Council, was:—Kent 0.7, Tottenham 1.2, East London (deepwell) 2.4, New River 2.5, Colne Valley 2.7, Chelsea 4.0, East London (river supply) 4.1, Grand Junction 4.6, West Middlesex 5.2, Lambeth 5.9, and Southwark 6.0. The unfiltered river waters contained the following proportions:—Thames at Hampton 7.9, New River Cut 5.8, and the Lea at Angel Road 9.0.

z z 2

The Thames at Hampton was, on October 8th, turbid and deep yellow in colour. It was of bad chemical, and very bad bacterial quality. By storage for 13 days, however, the Chelsea Company supplied their filters with water containing only about one fortieth as many microbes per c.c. as the raw river water on the same day. As delivered by the five Companies drawing their supplies from this river, the water was, in every case, efficiently filtered. As is usual at this season of the year, all the Thames-derived waters contained more organic matter of vegetable origin than was the case in the earlier months of the year. They were, however, all of fairly good chemical quality for dietetic purposes, and, with one exception, the bacterial quality was most excellent. The bacterial improvement effected by the various Companies is expressed by the following perceutage numbers:—Chelsea 99.98, West Middlesex 99.92, Southwark (No. 4 filter) 99.99, (No. 8 filter) 99.93, Grand Junction (general well at Hampton) 99.68, (general well at Kew) 99.97, (south well at Kew) 99.98, and Lambeth 99.97.

The New River Cut, before entering the storage and subsidence reservoirs of the New River Company, was, on October 10th, of moderate chemical and bacterial quality. It was turbid and yellow in colour; but, after efficient filtration, it was delivered in excellent chemical and bacterial condition. The bacterial improvement effected by this Company is expressed by the following percentage numbers:—general filter well 99·73, and filter wells, Nos. 1 and 7, 99·91. The water taken from the Lea at Angel Road by the East London Company was of bad chemical and of indifferent bacterial quality. It was turbid and deep yellow in colour from the presence of a considerable quantity of vegetable organic matter; but, after efficient filtration, it was delivered in a clear condition and of excellent bacterial quality; the bacterial improvement being expressed by the following percentage numbers:—Middlesex well 99·38, No. 1 Essex well 99·74, and No. 2 Essex well 99·57.

The deep-well waters of the Kent Company and of the Tottenham Urban District Council were of excellent chemical quality, but the supplies of the Colne Valley and East London Companies contained, for deep-well water, rather a large proportion of organic matter. The Tottenham and East London waters were also very slightly turbid from suspended particles of oxide of iron and chalk. The other deep-well waters were bright; that delivered by the Kent Company was of excellent bacterial quality, and the Colne Valley Company's water was, as usual, softened before delivery.

Seen through a stratum two feet deep, the Kent and Colne Valley waters were clear and colourless, the Tottenham and East London (deep well) were very slightly turbid and colourless, the New River clear and very pale yellow, and the remaining waters clear and pale yellow.

The bacterioscopic examination of the raw river waters, before and after storage, and of the supplies delivered by the various Companies and collected on the 8th, 9th, 10th, and 12th of October, yielded, after incubation for five days, the results contained in the following table:—

Description.	Microbes per c.c.	Temp. C.

* Analysed by Dr. Alfred Hill, F.I.C., Medical Officer of Health and Analyst to the City. † Analysed by Dr. E. J. Mills, F.R.S., of the Glasgow and West of Scotland Technical College.

All the numbers in columns 4, 5, 6, 7, 8, 9, 10, and 11, relate to 100,000 parts of the waters. The Table is to be read thus:—the Thames water at the Grand Junction Company's intake at Hampton, collected on the 8th of October 1896, had a temperature of 12 6° C.; 100,000 lbs. of it contained 32 80 lbs. of solid matter; the organic substances, constituting a portion of this matter, contained 421 lb. of carbon and '048 lb. of nitrogen. The above quantity of water also contained '006 lb. of ammonia and '242 lb. of nitrogen in the form of nitrates and nitrites, whilst the total amount of combined nitrogen in every form was '295 lb. The above weight of water also contained 2 2 lb. of chlorine, and 20 0 lbs. of carbonate of lime, or an equivalent amount of other hardening or soap-destroying ingredients.

of other hardening or soap-destroying ingredients.

The numbers in the analytical Table can be converted into grains per imperial gallon by multiplying them by 7, and then moving the decimal point one place to the left. The same operation transforms the hardness in the Table into degrees of hardness on Clark's scale.

Dr. Hill, F.I.C., Medical Officer of Health for Birmingham, reports that the water supplied to that city was "slightly turbid and yellowish green in a two-foot tube."

Dr. Mills, F.R.S., of the Glasgow and West of Scotland Technical College, reports that the water supplied to that city from Loch Katrine was "light brown in colour, and contained a "little suspended matter."

The Registrar General, &c. &c.

I am, &c. E. Frankland.

on, so cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical then the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of not certified by a registered practitioner, the case is returned under the heading "no statement." evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of murder, manslaughter, or suicide. All such cases are classed under "accident."

## WEEKLY RETURN

#### BIRTHS AND DEATHS IN LONDON

AND IN

## THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 47. 1896. Vol. LVII. WEEK ENDING SATURDAY, NOVEMBER 21. [Price 1 d.

General Register Office, Somerset House, November 23rd, 1896.

### THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 21.3 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending	3	Programme Control		Weeks	ending	3

220000		24·3 19·4	21.9	20·8 22·8	Swansea West Ham Wolverhampton -	15.2	19.4	22·2 15·4 23·5	19.4

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.0 in Derby, 1.2 in Hull, 1.4 in Bradford, 2.1 in Gateshead, and 2.9 in Plymouth; from scarlet fever, 1.0 in West Ham; and from whooping-cough, 1.0 in Birkenhead, and 1.1 in Swansea. In no case did the death-rate from "fever" or from diarrhæa reach 1.0 per 1000 in any of the thirty-three towns. The 90 deaths from diphtheria included 59 in London, 8 in Birmingham, 4 in West Ham, and 4 in Cardiff. No death from small-pox was registered in any of the thirty-three towns.

#### LONDON.

In London 2688 BIRTHS and 1688 DEATHS were registered. Allowing for increase of population, the births were 33, and the deaths 3, above the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate *mall-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are for the purposes of Tables 1, 6, and 7 added to the Outer Ring, or to other areas to which they belong.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 20·2, 20·2, and 19·8 in the preceding three weeks, rose again last week to 19·9. During the four weeks ending on Saturday last the death-rate averaged 20·0 per 1000, being 0·5 per 1000 above the mean rate in the corresponding periods of the ten years 1886–95.

The 1688 deaths included 11 from measles, 20 from scarlet fever, 59 from diphtheria, 21 from whooping-cough, 18 from enteric fever, 11 from diarrhea and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 140 deaths were referred to these

diseases, being 66 below the corrected average weekly number.

The deaths from measles, which had been 12, 19, and 12 in the preceding three weeks, were 11 last week, the corrected average being 60; 3 cases belonged to Poplar sanitary area. The deaths from scarlet fever, which had been 11, 18, and 21 in the preceding three weeks, were 20 last week, the corrected average being 28; 3 cases belonged to Camberwell sanitary area. The deaths from diphtheria, which had been 64, 53, and 60 in the preceding three weeks, were 59 last week, exceeding the corrected average by 12; 6 cases belonged to Camberwell, 5 to St. Pancras, 5 to Lambeth, 4 to Islington, 4 to Shoreditch, 4 to Battersea, 3 to Kensington, and and 3 to Newington sanitary areas. The deaths from whooping-cough, which had been 19, 8, and 21 in the preceding three weeks, were again 21 last week, the corrected average being 34. The fatal cases of enteric fever, which had been 27, 15, and 17 in the preceding three weeks, were 18 last week, the corrected average being 19; 3 cases belonged to Hackney sanitary area. The deaths from diarrheea, which had been 13, 13, and 7 in the preceding three weeks, rose again last week to 11, but were 5 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 387, 440, and 492 in the preceding three weeks, fell again last week to 472, but were 42

above the corrected average.

The deaths attributed directly to influenza numbered 14, having been 13, 15, and

10 in the preceding three weeks.

Different forms of violence caused 60 deaths, concerning all but 1 of which inquests were held. Of these 60 deaths, 7 were cases of suicide, and 1 of homicide, while the remaining 52 were attributed to accident or negligence. Six of these were referred to vehicles in the streets, 3 to conflagrations, and 16 (including 14 of infants under one year of age) to suffocation in bed.

### Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 1 case of small-pox, 4092 cases of scarlet fever, 811 of diphtheria, and 145 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, not one case, against 1, 0, and 0; of scarlet fever, 398 cases, against 367, 384, and 362; of diphtheria, 111 cases, against 122, 115, and 108; and of enteric fever, 20 cases, against 21, 28, and 25.

#### GREATER LONDON.

In Greater London 3665 births and 2210 deaths were registered, corresponding to annual rates of 30.9 and 18.7 per 1000 of the estimated population. In the Outer Ring, 7 deaths from measles, 6 from scarlet fever, 19 from diphtheria, 8 from whooping-cough, 6 from "fever," and 10 from diarrhea were registered. Four deaths from measles, 6 from scarlet fever, 6 from diphtheria, and 4 from "fever" occurred in West Ham district; 4 deaths from diphtheria occurred in Edmonton district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.82 inches, and that of the Thermometer 42°.7, the latter being 0°.4 above the week's average in the 50 years 1841–90. The direction of the wind was variable, the horizontal movement of the air being 7 per centbelow the week's average in the 16 years 1860–75. The duration of registered bright sunshine in the week was 6.2 hours. The measured rainfall amounted to 0.18 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox. Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5°541 per cent. for increase of lation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of a is not certified by a registered practitioner, the case is returned under the heading" no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of ent, murder, manslaughter, or suicide. All such cases are classed under "accident."

## WEEKLY RETURN

#### BIRTHS AND IN DEATHS LONDON

AND IN

#### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

WEEK ENDING SATURDAY, NOVEMBER 28. [Price 11d. No. 48. 1896. Vol. LVII.]

> General Register Office, Somerset House, November 30th, 1896,

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 19.3 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alplabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending			.		Weeks	ending	
Towns.	Nov.	Nov. 14.	Nov. 21.	Nov. 28.	Towns.		Nov.	Nov. 14.	Nov. 21.	Nov. 28.

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.8 in Nottingham, 2.1 in Bradford, 2.6 in Gateshead, and 1.2 in Hull; from whooping-cough, 1.6 in Swansea; from "fever", 1.3 in Bolton, and 1.8 in Wolverhampton; and from diarrhea, 2.4 in Wolverhampton. The 86 deaths from diphtheria included 48 in London, 5 in Liverpool, 4 in West Ham, 4 in Manchester, 3 in Cardiff, 3 in Birmingham, 3 in Leicester, 3 in Leeds, and 3 in Sheffield. No death from small-pox was registered in any of the thirty-three towns.

#### LONDON.

In LONDON 2530 BIRTHS and 1596 DEATHS were registered. Allowing for increase of population, the births were 33 above, and the deaths 77 below, the average

^{*}By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Highgate small-pox Hospital has the London Fever Hospital, in the Middlesex County Lunatic Asylums Board Wospitals within Registration London. As far as Wandsworth, and in the Metropolitan Asylums Board Wospitals within Registration London. As far as Wandsworth, and the country Lunatic Asylums Board Hospitals within Registration London. As far as Wandsworth, and excluded from Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Eing, er to other areas to which they belong. A 93941.—9. 650.—12/96. Wt. 124.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 20·2, 19·8, and 19·9 in the preceding three weeks, fell again last week to 18·8. During the four weeks ending on Saturday last the death-rate averaged 19·7 per 1000, being 0·1 per 1000 above the mean rate in the corresponding periods of the ten years 1886-95.

The 1596 deaths included 19 from measles, 19 from scarlet fever, 48 from

The 1596 deaths included 19 from measles, 19 from scarlet fever, 48 from diphtheria, 17 from whooping-cough, 17 from enteric fever, 13 from diarrhæa and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 133 deaths were referred to these

diseases, being 71 below the corrected average weekly number.

The deaths from measles, which had been 19, 12, and 11 in the preceding three weeks, rose again last week to 19, but were 43 below the corrected average; 4 cases belonged to Limehouse and 4 to Poplar sanitary areas. The deaths from scarlet fever, which had been 18, 21, and 20 in the preceding three weeks, were 19 last week, the corrected average being 28. The deaths from diphtheria, which had been 53, 60, and 59 in the preceding three weeks, fell last week to 48, but were 4 above the corrected average; 3 cases belonged to Chelsea, 3 to St. Marylebone, 3 to Bethnal Green, 3 to Poplar, 3 to Newington, 3 to Bermondsey, 3 to Camberwell, and 3 to Woolwich sanitary areas. The deaths from whooping-cough, which had been 8, 21, and 21 in the preceding three weeks, fell again last week to 17, and were 19 below the corrected average; 3 cases belonged to St. Pancras sanitary area. The fatal cases of enteric fever, which had been 15, 17, and 18 in the preceding three weeks, were 17 last week, this number being also the corrected average; 3 cases belonged to Poplar, 3 to Battersea, and 2 to Chelsea sanitary areas. The deaths from diarrhæa, which had been 13, 7, and 11 in the preceding three weeks, further rose last week to 13, but were 4 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 440, 492, and 472 in the preceding three weeks, further fell last week to 435, but were 18

above the corrected average.

The deaths attributed directly to influenza numbered 17, having been 15, 10, and

14 in the preceding three weeks.

Different forms of violence caused 67 deaths, concerning all but 2 of which inquests were held. Of these 67 deaths, 3 were cases of suicide, and 2 of homicide, while the remaining 62 were attributed to accident or negligence. Six of these were referred to vehicles in the streets, 4 to conflagrations, one to the effects of an anæsthetic administered for surgical purposes, and 13 (of infants under one year of age) to suffocation in bed.

#### CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 1 case of small-pox, 4030 cases of scarlet fever, 788 of diphtheria, and 137 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, not one case, against 0, 0, and 0; of scarlet fever, 333 cases, against 384, 362, and 398; of diphtheria, 110 cases, against 115, 108, and 111; and of enteric fever, 16 cases, against 28, 25, and 20.

#### GREATER LONDON.

In Greater London 3475 births and 2104 deaths were registered, corresponding to annual rates of 29°3 and 17°8 per 1000 of the estimated population. In the Outer Ring, 8 deaths from measles, 2 from scarlet fever, 11 from diphtheria, 7 from whooping-cough, 3 from "fever," and 3 from diarrhea were registered. Four deaths from measles occurred in Kingston sub-district; 3 deaths from measles and 8 from diphtheria occurred in West Ham district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 30.20 inches, and that of the Thermometer 39.3, the latter being 2.5 below the week's average in the 50 years 1841-90. The direction of the wind was Easterly, the horizontal movement of the air being 1 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 5.3 hours. The measured rainfall amounted to 0.02 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

The numbers in this c	olumn ar	a the	937	arga	CO TH	nek	lw c	loot	he fo	r the ten years 1886-95, raise	d by 5.5	41 ne	r ce	nt.	for	ire	PARS	A 0	f

A 93941.—9.

The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of lation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of his not certified by a registered practitioner, the case is returned under the heading" no statement."

The evidence at inquests is often insufficient to enable the Cyroner to certify whether a violent death be the result of lent, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. L()NDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measler Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in each Sub-district during the Week ending Saturday, 28th November, 1896.

WEEK ENDING SATURDAY, DECEMBER 5. No. 49, 1896, Vol. LVII.] Price  $1\frac{1}{2}d$ .

> General Register Office, Somerset House, December 7th, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 19.4 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:—

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1·1 in Halifax, 1·4 in Nottingham, 1·5 in mortality, were:—from meastes, 1.1 in Halifax, 1.4 in Nottingham, 1.5 in Newcastle-on-Tyne, 1.7 in Plymouth, 2.1 in Gateshead, and 2.5 in Bradford; from scarlet fever, 1.0 in Leicester and in Birkenhead; from whooping-cough, 1.1 in Nottingham, 1.4 in Birkenhead, and 1.6 in Huddersfield; and from diarrhea, 1.0 in Burnley, and 1.2 in Blackburn. In no case did the death-rate from "fever" reach 1.0 per 1000 in any of the thirty-three towns. The 87 deaths from diphtheria included 60 in London, 9 in Birmingham, 4 in Manchester, and 3 in Oldham. No death from small-pox was registered in any of the thirty-three towns.

#### LONDON.

In LONDON 2419 BIRTHS and 1604 DEATHS were registered. Allowing for increase of population, the births were 152, and the deaths 162, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate

^{*}By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgade Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as Wandsworth, and in the Metropolitan Registration London are for the purposes of Tables 1, 6, and 7, added to the Outer Ring, or to other areas to which they belong.

per 1000 from all causes, which had been 19.8, 19.9, and 18.8 in the preceding three weeks, rose again last week to 18.9. During the four weeks ending on Saturday last the death-rate averaged 19.4 per 1000, being 0.6 per 1000 below the

mean rate in the corresponding periods of the ten years 1886-95.

The 1604 deaths included 17 from measles, 26 from scarlet fever, 60 from diphtheria, 18 from whooping-cough, 9 from enteric fever, 7 from diarrhea and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 137 deaths were referred to these diseases, being 78 below the corrected average weekly number.

The deaths from measles, which had been 12, 11, and 19 in the preceding three weeks, fell again last week to 17, and were only one-fourth of the corrected average; 5 cases belonged to Poplar sanitary area. The deaths from scarlet fever, which had been 21, 20, and 19 in the preceding three weeks, rose last week to 26, which is also the corrected average; 3 cases belonged to Islington, 2 to Kensington, 2 to Hammersmith, 2 to St. Marylebone, 2 to Clerkenwell, 2 to St. George-in-the-East, and 2 to Camberwell sanitary areas. The deaths from diphtheria, which had been 60, 59, and 48 in the preceding three weeks, rose again last week to 60, and exceeded the corrected average by 10; 5 cases belonged to Islington, 5 to Hackney, 4 to Camberwell, 3 to Limehouse, 3 to Poplar, 3 to Bermondsey, 3 to Lambeth, and 3 to Greenwich sanitary areas. The deaths from whooping-cough, which had been 21, 21, and 17 in the preceding three weeks, rose again last week to 18, but were 20 below the corrected average; 5 cases belonged to St. Pancras sanitary area. The fatal cases of enteric fever, which had been 17, 18, and 17 in the preceding three weeks, fell again last week to 9, and were 10 below the corrected average; 2 cases belonged to Paddington and 2 to Hackney sanitary areas. The deaths from diarrhea, which had been 7, 11, and 13 in the preceding three weeks, fell again last week to 7, the corrected average being 13.

The deaths referred to diseases of the respiratory organs, which had been 492, 472, and 435 in the preceding three weeks, further fell last week to 374, and were

68 below the corrected average.

The deaths attributed directly to influenza numbered 19, having been 10, 14, and

17 in the preceding three weeks.

Different forms of violence caused 68 deaths, concerning all but 1 of which inquests were held. Of these 68 deaths, 6 were cases of suicide, and 1 of homicide, while the remaining 61 were attributed to accident or negligence. Four of these were referred to vehicles in the streets, 2 to a conflagration, and 10 (of infants under one year of age) to suffocation in bed.

### Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 1 case of small-pox, 3989 cases of scarlet fever, 805 of diphtheria, and 140 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:-Of small-pox, not one case, against 0, 0, and 0; of scarlet fever, 350 cases, against 362, 398, and 333; of diphtheria, 115 cases, against 108, 111, and 110; and of enteric fever, 19 cases, against 25, 20, and 16.

#### GREATER LONDON.

In Greater London 3288 births and 2082 deaths were registered, corresponding to annual rates of 27.8 and 17.6 per 1000 of the estimated population. In the Outer Ring, 4 deaths from measles, 2 from scarlet fever, 13 from diphtheria, 11 from whooping-cough, 5 from "fever," and 6 from diarrhea were registered. Six deaths from diphtheria occurred in West Ham district, 4 from whooping-cough in Uxbridge district, and 2 from fever in Hornsey sub-district.

## METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.51 inches, and that of the Thermometer 39.8, the latter being 1.1 below the week's average in the 50 years 1841-90. The direction of the wind was Southerly, the horizontal movement of the air being 11 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 13.8 hours. The measured rainfall amounted to 1.46 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

93941.-10.

^{*} The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5 541 per cent. for increase of population.

† Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical men. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of leath is not certified by a registered practitioner, the case is returned under the heading "no statement."

‡ The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of secident, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measles Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhgea, Violence, &c., registered in each Sub-district during the Week ending Saturday, 5th December, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT Towns of England and Wales corresponded to an annual rate of 18.9 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:—

		Weeks	ending		The second second		Weeks	ending	
Towns.	Nov. 21.	Nov. 28.	Dec. 5.	Dec. 12.	Towns.	Nov. 21.	Nov. 28.	Dec. 5.	Dec. 12.
Birkenhead Birmingham Blackburn - Bolton - Bradford - Brighton - Bristol - Burnley - Cardiff - Croydon - Derby - Gateshead - Halifax - Huddersfield Hull - Leeds - Leicester -	19.6 24.2 21.7 29.9 19.6 20.1 21.3 26.3 16.3 17.4 21.2 20.4 16.1 20.8 22.8	20·5 18·6 27·4 17·3 19·6 22·1 18·8 16·7 15·9 15·9 19·1 14·3 19·2 21·2 18·7	24·3 22·4 19·7 16·9 18·7 21·6 18·3 15·7 17·2 17·4 22·8 19·3 18·7 17·9 20·2	21.5 21.5 20.1 19.9 16.6 23.4 15.6 18.3 21.8 12.4 16.9 24.9 19.3 21.3	Liverpool London Manchester - Newcastle-on-Tyne Norwich - Nottingham - Oldham Plymouth - Portsmouth - Preston Salford Sheffield - Sunderland - Swansea - West Ham Wolverhampton -	29·2 19·9 28·6 18·9 12·5 21·6 18·2 25·4 18·7 33·4 20·8 18·2 18·2 21·7	23·3 18·8 21·9 17·4 23·0 18·6 14·2 23·1 16·1 25·6 17·6 17·5 22·2 216·2 33·1	18·9 18·6 18·7 19·2 19·3 22·2 28·3 13·4 22·9 21·0 18·2 16·0 28·0 12·4	18·1 24·4 16·0 17·3 21·1 22·5 19·1 16·9 21·5 21·8 15·9 15·6 23·8

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.6 in Bradford, 1.7 in Plymouth, and 3.0 in Nottingham; from scarlet fever, 1.4 in Birkenhead; from whooping-cough, 1.0 in Birkenhead, 1.1 in Swansea and in Sunderland, 2.0 in Nottingham, and 3.1 in Huddersfield; and from "fever" 1.0 in Salford. In no case did the death-rate from diarrhea reach 1.0 per 1000 in any of the thirty-three towns. The 78 deaths from diphtheria included 52 in London, 5 in Liverpool, 3 in Birmingham, and 3 in Leicester. No death from small-pox was registered in any of the thirty-three towns.

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

A 93941.—11. 659.—12/96. Wt. 124.

#### LONDON.

In London* 2555 BIRTHS and 1539 DEATHS were registered. Allowing for increase of population, the births were 22, and the deaths 213, below the average numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 19.9, 18.8, and 18.9 in the preceding three weeks, fell again last week to 18.1. During the four weeks ending on Saturday last the death-rate averaged 18.9 per 1000, being 1.4 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1539 deaths included 16 from measles, 16 from scarlet fever, 52 from diphtheria, 25 from whooping-cough, 13 from enteric fever, 1 from an ill-defined form of continued fever, 11 from diarrhea and dysentery, and not one death from small-pox, from typhus, or from cholera; thus, 134 deaths were referred to these

diseases, being 78 below the corrected average weekly number.

The deaths from measles, which had been 11, 19, and 17 in the preceding three weeks, were 16 last week, the corrected average being 63; 3 cases belonged to Limehouse, 3 to Poplar, and 3 to Rotherhithe sanitary areas. The deaths from scarlet fever, which had been 20, 19, and 26 in the preceding three weeks, fell again last week to 16, and were 7 below the corrected average; 2 cases belonged to Fulham, 2 to St. Giles, and 2 to Greenwich sanitary areas. The deaths from diphtheria, which had been 59, 48, and 60 in the preceding three weeks, fell again last week to 52, but were 5 above the corrected average; 5 cases belonged to Islington, 4 to Bermondsey, 3 to Paddington, 3 to Camberwell, and 3 to Woolwich sanitary areas. The deaths from whooping-cough, which had been 21, 17, and 18 in the preceding three weeks, further rose last week to 25, but were 20 below the corrected average; 4 cases belonged to Lambeth and 3 to Fulham sanitary areas. The fatal cases of enteric fever, which had been 18, 17, and 9 in the preceding three weeks, rose again to 13 last week, but were 6 below the corrected average. The deaths from diarrhea, which had been 11, 13, and 7 in the preceding three weeks, rose again last week to 11, but were 3 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 472, 435, and 374 in the preceding three weeks, further fell last week to 346, and were

101 below the corrected average.

The deaths attributed directly to influenza numbered 19, having been 14, 17, and 19 in the preceding three weeks.

Different forms of violence caused 67 deaths, concerning all but 2 of which inquests were held. Of these 67 deaths, 7 were cases of suicide, and 1 of homicide, while the remaining 59 were attributed to accident or negligence. One of these was referred to a vehicle in the streets, 1 to a conflagration, 2 to the effects of anæsthetics administered for surgical purposes, and 15 (including 14 of infants under one year of age) to suffocation in bed.

# Cases of Infectious Sickness in Hospitals.†

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 1 case of small-pox, 3971 cases of scarlet fever, 817 of diphtheria, and 129 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:-Of small-pox, not one case, against 0, 0, and 0; of searlet fever, 353 cases, against 398, 333, and 350; of diphtheria, 126 cases, against 111, 110, and 115; and of enteric fever, 9 cases, against 20, 16, and 19.

^{*} Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at practicable the deaths thus excluded from Registration London law for the purposes of Tables 1, 6, and 7, + The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

#### GREATER LONDON.

In Greater London 3521 births and 1951 deaths were registered, corresponding to annual rates of 29.7 and 16.5 per 1000 of the estimated population. In the Outer Ring, 7 deaths from measles, 3 from scarlet fever, 11 from diphtheria, 4 from whooping-cough, 2 from "fever," and 4 from diarrhea were registered. Five deaths from measles occurred in West Ham district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.40 inches, and that of the Thermometer 43.8, the latter being 3.4 above the week's average in the 50 years 1841-90. The direction of the wind was South-Westerly, the horizontal movement of the air being 14 per cent, above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 1.0 hours. The measured rainfall amounted to 0.39 of an inch.

#### RETURNS OF LONDON WATER COMPANIES.

The London Water Companies have been good enough to furnish the following account of the number of services and the average daily amount of water supplied during the month of November. The supply was in the ratio of 227 gallons to one service.

COMPANIES.	Number o	Services.	Daily Suppl in Gal	y of Water llons.

Note.—The Return for November 1896, as compared with that for the corresponding month of 1895, shows an increase of 13,672 services and a decrease of 13,605,048 gallons of water supplied daily.

## Analysis of Metropolitan Water Supply during November, 1896.

Water-analysis Laboratory, The Yews, Reigate, 7th December, 1896.

I HAVE to report to you the results of the chemical analysis, and of the physical and bacterioscopic examination, of the waters supplied to the inner, and portions of the outer, circle of the Metropolis during the month of November.

At the request of the Associated Metropolitan Water Companies, I have extended these monthly examinations to (a) the chemical and bacterioscopic condition of the raw river waters at the intakes of the various Companies, and (b) to the bacteriology of the water as it issues from the filter beds of each Company, and before it is pumped into the distributing mains.

I append, also, the results obtained in the analyses of the waters supplied to Birmingham and Glasgow by their respective Corporations. These analyses were made by Dr. Hill of Birmingham and Dr. Mills of Glasgow.

Taking the average amount of organic impurity in a given volume of the Kent Company's water during the nine years ending December 1876 as unity, the proportional amount contained in an equal volume of water supplied by each of the Metropolitan Water Companies and by the Tottenham Urban District Council, was:—Kent 0.7, Tottenham 1.3, New River and East London (deep-well) 2.1, Colne Valley 1.9, Grand Junction and East London (river supply) 3.9, Southwark 4.1, Lambeth 4.2, West Middlesex 4.6, and Chelsea 5.2. The unfiltered river waters contained the following proportions:—Thames at Hampton 5.4, New River Cut 1.9, and the Lea at Angel Road 3.7.

The Thames at Hampton was, on November 4th, turbid and yellow in colour. It was of fairly good chemical, but indifferent bacterial quality. After storage for 13 days by the Chelsea Company, it was greatly improved in bacterial quality, but the chemical condition was searcely altered. As delivered by the five Companies drawing their supplies from this river, the water was, in every case, efficiently filtered, but it contained a rather large proportion of vegetable organic matter, which is not unusual at this season of the year. With two exceptions, the bacterial quality of the water drawn from the various filter wells of the Companies was excellent. The bacterial improvement effected by the various Companies is expressed by the following percentage numbers:—Chelsea 99·86, West Middlesex 99·71, Southwark (No. 3 filter) 99·12, (No. 8 filter) 97·57, Grand Junction (general well at Hampton) 97·15, (general well at Kew) 99·18, (south filter) 99·81, and Lambeth 99·72.

The New River Cut, before entering the storage and subsidence reservoirs of the New River Company, was, on November 6th, turbid and pale yellow in colour. It was of good chemical, but of inferior bacterial quality. After efficient filtration, it was delivered in excellent chemical condition. The bacterial improvement effected by this Company is expressed by the following percentage numbers:—general filter well 96.68, filter well No. 3, 99.67, and filter well No. 2, 99.42. The water taken from the Lea at Angel Road by the East London Company was of fairly good chemical, but bad bacterial quality. After efficient filtration it was delivered in excellent bacterial quality, and, as regards chemical condition, was better than the average of the Thames derived waters. The bacterial improvement effected by this Company's filters is expressed by the following percentage numbers:—general filter well 99.67, No. 1 Essex well 99.25 and No. 2 Essex well 99.38.

The deep-well waters of the Kent, Colne Valley, and East London Companies, and of the Tottenham Urban District Council were of excellent chemical quality, but the water distributed by the Tottenham Urban District Council and the East London Company was more or less turbid. The other deep-well waters were bright; and that delivered by the Kent Company was also of good bacterial quality, whilst the Colne Valley Company's water was, as usual, softened before delivery. The water drawn by the East London Company from their East Ham well was, however, initially nearly as soft as the Colne Valley Company's supply after treatment by Clark's process.

Seen through a stratum two feet deep, the Kent and Colne Valley waters were clear and colourless, the Tottenham colourless and slightly turbid, and the East London (deep well) colourless and turbid, the New River clear and nearly colourless, and the remaining waters clear and pale yellow.

The bacterioscopic examination of the raw river waters, before and after storage, and of the supplies delivered by the various Companies and collected on the 4th, 5th, 6th, and 9th of November, yielded, after incubation for from three to seven days, the results contained in the following table:—

Description.	Microbes per c.c.	Temp. C.

Analysed by Dr. Alfred Hill, F.I.C., Medical Officer of Health and Analyst to the City.
 † Analysed by Dr. E. J. Mills, F.R.S., of the Glasgow and West of Scotland Technical College.

All the numbers contained in columns 4, 5, 6, 7, 8, 9, 10, and 11, relate to 100,000 parts of the waters. The Table is to be read thus:—the Thames water at the Grand Junction Company's intake at Hampton, collected on the 4th of November 1896, had a temperature of 5 8° C.; 100,000 lbs. of it contained 39 00 lbs. of solid matter; the organic substances, constituting a portion of this matter, contained 254 lb. of carbon and 066 lb. of nitrogen. The above quantity of water also contained 1008 lb. of ammonia and 1278 lb. of nitrogen in the form of nitrates and nitrites, whilst the total amount of combined nitrogen in every form was 1351 lb. The above weight of water also contained 20 lb. of chlorine, and 22 4 lbs. of carbonate of lime, or an equivalent amount of other hardening or soap-destroying ingredients.

The numbers in the analytical Table can be converted into grains per imperial gallon by multiplying them by 7, and then moving the decimal point one place to the left. The same operation transforms the hardness in the Table into degrees of hardness on Clark's scale.

Dr. Hill, F.I.C., Medical Officer of Health for Birmingham, reports that the water supplied to that city was "almost clear and pale green in a two-foot tube."

Dr. Mills, F.R.S., of the Glasgow and West of Scotland Technical College, reports that the water supplied to that city from Loch Katrine was "light brown in colour, and contained a "little suspended matter."

The Registrar General, &c. &c.

I am, &c. E. Frankland.

* The numbers in this	oolumes e	wo Ale						3	17	or the ten years 1886-95, rai		- 17							

^{*} The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5'541 per cent. for increase of population.

† Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical men. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of death is not certified by a registered practitioner, the case is returned under the heading "no statement."

† The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of accident, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measles, Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in each Sub-district during the Week ending Saturday, 12th December, 1896.

Note.—The Italic letters placed against the names of the sub-districts denote Public Institutions situated therein, namely: W—Workhouse; H—Hospital; L—Lunatic Asylum;  $L^*$ —Private Lunatic Asylum in which paupers are received; w—Workhouse Establishment receiving inmates from other Districts than that in which it stands. The Roman capitals signify the Water Companies which supply the different Sub-districts;—G. signifies Grand Junction Company; W. West Middlesex; C. Chelsea; C. Southwark and Vauxhall; C. Lambeth; C. Now River; C. East London; and C. the Kent Company.

* See note † on first page of this Beturn.

## WEEKLY RETURN

#### BIRTHS AND DEATHS IN LONDON

AND IN

#### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 51. 1896. Vol. LVII.] WEEK ENDING SATURDAY, DECEMBER 19.

General Register Office, Somerset House, December 21st, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 18.2 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending	3				Weeks	ending	5

Leeds -	18.7	20.2	17.5	17.8	Wolverhampton	-	33.1	18.7	18.7	19.9
Leicester -	16.0			15.2	1					

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.0 in Cardiff, 1.1 in Gateshead, 1.7 in Newcastle-on-Tyne, 2:0 in Nottingham, and 3:4 in Bradford; from scarlet fever, 1:3 in Leicester and 1.4 in Birkenhead; and from whooping-cough, 1.0 in Birkenhead, in Burnley, and in Huddersfield, 1.1 in Bristol, 2.0 in Nottingham, and 2.6 in Swansea. In no case did the death-rate from "fever" or from diarrhea reach 1.0 per 1000 in any of the thirty-three towns. The 86 deaths from diphtheria included 58 in London, 3 in West Ham, 3 in Birmingham, and 3 in Hull No death from small-pox was registered in any of the thirty-three towns.

#### LONDON.

In London† 2522 BIRTHS and 1459 DEATHS were registered. Allowing for ncrease of population, the births were 71 above, and the deaths 379 below, the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.

† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylum's situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are, for the purposes of Tables 1, \( \cepsilon \), and \( 7 \), added to the Outer Ring, or to other areas to which they belong.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 18.8, 18.9, and 18.1 in the preceding three weeks, further fell last week to 17.2. During the four weeks ending on Saturday last the death-rate averaged 18.3 per 1000, being 2.4 per 1000 below the mean rate in the corresponding periods of the ten years 1886–95.

The 1459 deaths included 15 from measles, 19 from scarlet fever, 58 from

The 1459 deaths included 15 from measles, 19 from scarlet fever, 58 from diphtheria, 20 from whooping-cough, 15 from enteric fever, 9 from diarrhæa and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 136 deaths were referred to these

diseases, being 93 below the corrected average weekly number.

The deaths from measles, which had been 19, 17, and 16 in the preceding three weeks, further fell last week to 15, the corrected average being 80; 4 cases belonged to Mile End Old Town, 3 to Limehouse, 2 to Poplar, and 2 to St. Luke sanitary areas. The deaths from scarlet fever, which had been 19, 26, and 16 in the preceding three weeks, rose again last week to 19, but were 6 below the corrected average; 3 cases belonged to Newington, 3 to Wandsworth, and 2 to Lambeth sanitary areas. The deaths from diphtheria, which had been 48, 60, and 52 in the preceding three weeks, rose again last week to 58, and were 18 above the corrected average; 10 cases belonged to Camberwell, 6 to Lambeth, 6 to Islington, 4 to Shoreditch, 3 to Fulham, 3 to Chelsea, 3 to Mile End Old Town, 3 to Poplar, and 3 to Battersea sanitary areas. The deaths from whooping-cough, which had been 17, 18, and 25 in the preceding three weeks, fell again last week to 20, and were 34 below the corrected average; 3 cases belonged to Camberwell sanitary The fatal cases of enteric fever, which had been 17, 9, and 13 in the preceding three weeks, further rose last week to 15, which is also the corrected average. The deaths from diarrhea, which had been 13, 7, and 11 in the preceding three weeks, fell again last week to 9, and were 5 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 435, 374, and 346 in the preceding three weeks, further fell last week to 302, and were

193 below the corrected average.

The deaths attributed directly to influenza numbered 8, having been 17, 19, and

19 in the preceding three weeks.

Different forms of violence caused 67 deaths, concerning all but 2 of which inquests were held. Of these 67 deaths, 12 were cases of suicide, and 2 of homicide, while the remaining 53 were attributed to accident or negligence. Eight of these was referred to vehicles in the streets, 11 to burns and scalds, and 13 (of infants under one year of age) to suffocation in bed.

#### Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals there were 3868 cases of scarlet fever, 828 of diphtheria, and 130 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of scarlet fever, 291 cases, against 333, 350, and 353; of diphtheria, 125 cases, against 110, 115, and 126; and of enteric fever, 20 cases, against 16, 19, and 9. There were no cases of small-pox under treatment in the Metropolitan Asylum or Highgate Small-pox Hospitals.

## GREATER LONDON.

In Greater London 3447 births and 1900 deaths were registered, corresponding to annual rates of 29°1 and 16°0 per 1000 of the estimated population. In the Outer Ring, 10 deaths from measles, 2 from scarlet fever, 10 from diphtheria, 18 from whooping-cough, 3 from "fever," and 2 from diarrhea were registered. Four cases of measles, 3 of diphtheria, and 5 of whooping-cough occurred in West Ham district; 3 deaths from diphtheria and 4 from whooping-cough occurred in Edmonton district.

#### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.44 inches, and that of the Thermometer 34°.6, the latter being 5°.3 below the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 20 per cent. below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 1.8 hours. The measured rainfall amounted to 0.39 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

* m	1	(7.			-	-	1	4	41-	for the ten years 1886-95, rai	and har 5.	541 n	er e	ent	fo	r ir	ere	900	of

^{*} The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of

population.

+ Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical men. When the medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the cause of death is not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the C romer to certify whether a violent death be the result of accident, murder, manslaughter, or suicide. All such cases are classed under 'accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measles Scarlet Feyer, Diphtheria, Whooping-cough, Fever, Diarrhea, Violence, &c., registered in each Sub-district during the Week ending Saturday, 19th December, 1896.

## WEEKLY RETURN

#### BIRTHS AND DEATHS IN LONDON

AND IN

#### THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 52. 1896. Vol. LVII. WEEK ENDING SATURDAY, DECEMBER 26. [Price  $1\frac{1}{2}d$ .

> General Register Office, Somerset House, December 28th, 1896.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in Thirty-three Great Towns of England and Wales corresponded to an annual rate of 17.0 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of this year. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

		Weeks	ending					Weeks	ending	7

Leicester -	19:9	12.9	15.2	16.8						

The highest annual death-rates per 1000 living, as measured by last week's mortality, were :- from measles, 1.1 in Nottingham, 1.6 in Gateshead, 2.1 in Bradford, and 4.0 in Plymouth; from whooping-cough, 1.0 in Birkenhead, in Salford, and in Huddersfield, and 2.8 in Blackburn; and from diarrhea, 1.1 in Halifax. In no case did the death-rate from scarlet fever or from "fever" reach 1.0 per 1000 in any of the thirty-three towns. The 68 deaths from diphtheria included 38 in London, 6 in West Ham, and 3 in Liverpool. No death from small-pox was registered in any of the thirty-three towns.

## LONDON.

In London† 1829 BIRTHS and 1279 DEATHS were registered. Allowing for increase of population, the births were 389, and the deaths 772, below the average

^{*} By "estimated" population is merely meant the number of persons who would be living if the mean ra of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far as practicable the deaths thus excluded from Registration London are, for the purposes of Tables 1, 6, and 7 added to the Outer Ring, or to other areas to which they belong.

numbers in the corresponding weeks of the last ten years. The annual death-rate per 1000 from all causes, which had been 18.9, 18.1, and 17.2 in the preceding three weeks, further fell last week to 15.1. During the four weeks ending on Saturday last the death-rate averaged 17.3 per 1000, being 4.5 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1279 deaths included 9 from measles, 12 from scarlet fever, 38 from diphtheria, 14 from whooping-cough, 9 from enteric fever, 6 from diarrheea and dysentery, and not one death from small-pox, from typhus, from any ill-defined form of continued fever, or from cholera; thus, 88 deaths were referred to these

diseases, being 158 below the corrected average weekly number.

The deaths from measles, which had been 17, 16, and 15 in the preceding three weeks, further fell last week to 9, the corrected average being 84; 3 cases belonged to Limehouse, 2 to Mile End Old Town, and 2 to Islington sanitary areas. The deaths from scarlet fever, which had been 26, 16, and 19 in the preceding three weeks, fell again last week to 12, and were 10 below the corrected average; 2 cases belonged to Islington and 2 to Newington sanitary areas. The deaths from diphtheria, which had been 60, 52, and 58 in the preceding three weeks, fell again last week to 38, and were 4 below the corrected average; 4 cases belonged to Lambeth, 3 to St. Marylebone, 3 to Islington, and 3 to Bermondsey sanitary areas. The deaths from whooping-cough, which had been 18, 25, and 20 in the preceding three weeks, further fell last week to 14, the corrected average being 65; 3 cases belonged to St. Marylebone sanitary area. The fatal cases of enteric fever, which had been 9, 13, and 15 in the preceding three weeks, fell again last week to 9, and were 8 below the corrected average; 2 cases belonged to Islington sanitary area. The deaths from diarrhæa, which had been 7, 11, and 9 in the preceding three weeks, further fell last week to 6, and were 9 below the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 374, 346, and 302 in the preceding three weeks, further fell last week to 284, and were

318 below the corrected average.

The deaths attributed directly to influenza numbered 10, having been 19, 19, and

8 in the preceding three weeks.

Different forms of violence caused 55 deaths, concerning all but 2 of which inquests were held. Of these 55 deaths, 5 were cases of suicide, and 2 of homicide, while the remaining 48 were attributed to accident or negligence. Four of these were referred to vehicles in the streets, 1 to the effects of an anæsthetic administered for surgical purposes, and 14 (including 12 of infants under one year of age) to suffocation in bed.

## CASES of INFECTIOUS SICKNESS in HOSPITALS.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, there were 3763 cases of scarlet fever, 850 of diphtheria, and 121 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of scarlet fever, 219 cases, against 350, 353, and 291; of diphtheria, 129 cases, against 115, 126, and 125; and of enteric fever, 9 cases, against 19, 9, and 20. There were no cases of small-pox under treatment last week in the Metropolitan Asylum or Highgate Small-pox Hospitals.

## GREATER LONDON.

In Greater London 2477 births and 1666 deaths were registered, corresponding to annual rates of 20.9 and 14.1 per 1000 of the estimated population. In the Outer Ring, 3 deaths from measles, 4 from scarlet fever, 14 from diphtheria, 9 from whooping-cough, 3 from "fever," and 2 from diarrhea were registered. Nine deaths from diphtheria occurred in West Ham district.

### METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 29.99 inches, and that of the Thermometer 37.7, the latter being 0.8 below the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 20 per cent. below the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 1.2 hours. The measured rainfall amounted to 0.47 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox Scarlet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable preportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

## WEEKLY RETURN

#### LONDON BIRTHS AND DEATHS IN

AND IN

## THIRTY-TWO OTHER CREAT TOWNS.

By Authority of the Registrar General.

Printed under the Superintendence of Her Majesty's Stationery Office, AND SOLD BY EYRE AND SPOTTISWOODE, 9, EAST HARDING ST., FETTER LANE, E.C.

No. 53. 1896. Vol. LVII.] WEEK ENDING SATURDAY, JANUARY 2, 1897. [Price 1 \frac{1}{2}d'

General Register Office, Somerset House, January 4th, 1897.

## THIRTY-THREE GREAT TOWNS.

The deaths registered last week in THIRTY-THREE GREAT TOWNS of England and Wales corresponded to an annual rate of 22.3 per 1000 of their aggregate population, which is estimated* at 10,846,971 persons in the middle of the year 1896. The deaths registered in each of the last four weeks in the several towns, alphabetically arranged, corresponded to the following annual rates per 1000:-

The highest annual death-rates per 1000 living, as measured by last week's mortality, were:—from measles, 1.0 in Derby and in Newcastle-on-Tyne, 1.3 in Cardiff, 1.4 in Bradford, 3.2 in Gateshead, 3.4 in Nottingham, and 4.6 in Plymouth; from scarlet fever, 1·1 in Oldham; from whooping-cough, 1·0 in Salford, 1·4 in Birkenhead, 1·6 in Huddersfield, 2·0 in Nottingham, and 2·1 in Swansea; from "fever," 1:6 in Gateshead; and from diarrhea, 1:2 in Wolverhampton and 1.6 in Blackburn. The 93 deaths from diphtheria included 49 in London, 8 in West Ham, 8 in Cardiff, 8 in Birmingham, 4 in Sheffield, and 3 in Liverpool. No death from small-pox was registered in any of the thirty-three towns.

### LONDON.

In LONDON 3041 BIRTHS and 1768 DEATHS were registered. Allowing for increase of population, the births were 823 above, and the deaths 283 below, the average numbers in the fifty-second weeks of the last ten years. The annual death-rate

^{*}By "estimated" population is merely meant the number of persons who would be living if the mean rate of increase in the last intercensal period had since been maintained.
† Including deaths of Londoners in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, but excluding deaths of persons not belonging to London occurring in the Highgate Small-pox Hospital, in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London. As far at Wandsworth, and in the scaluded from Registration London are, for the purposes of Tables 1.16, and 7, added to the Outer Ring, or to other areas to which they belong.

per 1000 from all causes, which had been 18·1, 17·2, and 15·1 in the preceding three weeks, rose again last week to 20·8. During the four weeks ending on Saturday last the death-rate averaged 17·8 per 1000, being 4·0 per 1000 below the mean rate in the corresponding periods of the ten years 1886-95.

The 1768 deaths included 14 from measles, 19 from scarlet fever, 49 from

The 1768 deaths included 14 from measles, 19 from scarlet fever, 49 from diphtheria, 46 from whooping-cough, 12 from enteric fever, one from an ill-defined form of continued fever, 15 from diarrhæa and dysentery, and not one death from small-pox, from typhus, or from cholera; thus, 156 deaths were referred to these

diseases, being 90 below the corrected average weekly number.

The deaths from measles, which had been 16, 15, and 9 in the preceding three weeks, rose again last week to 14, the corrected average being 84; 4 cases belonged to Poplar, 2 to Islington, 2 to Mile End Old Town, 2 to Newington, and 2 to Rotherhithe sanitary areas. The deaths from scarlet fever, which had been 16, 19, and 12 in the preceding three weeks, rose again last week to 19, but were 3 below the corrected average; 3 cases belonged to St. Luke, 2 to Paddington, 2 to London City, and 2 to Greenwich sanitary areas. The deaths from diphtheria, which had been 52, 58, and 38 in the preceding three weeks, rose again last week to 49, and were 7 above the corrected average; 5 cases belonged to Islington, 5 to Lambeth, 5 to Camberwell, 3 to St. Pancras, and 3 to Poplar sanitary areas. The deaths from whooping-cough, which had been 25, 20, and 14 in the preceding three weeks, rose again last week to 46, but were 19 below the corrected average; 7 cases belonged to Newington, 7 to Lambeth, 4 to St. Pancras, 3 to St. George Southwark, and 3 to Battersea sanitary areas. The fatal cases of enteric fever, which had been 13, 15, and 9 in the preceding three weeks, rose again to 12 last week, but were 5 below the corrected average; 2 cases belonged to Battersea sanitary area. The deaths from diarrhea, which had been 11, 9, and 6 in the preceding three weeks, rose again last week to 15, which is also the corrected average.

The deaths referred to diseases of the respiratory organs, which had been 346, 302, and 284 in the preceding three weeks, rose again last week to 348, but were

254 below the corrected average.

The deaths attributed directly to influenza numbered 14, having been 19, 8, and

10 in the preceding three weeks.

Different forms of violence caused 98 deaths, concerning all but 3 of which inquests were held. Of these 98 deaths, 8 were cases of suicide, and 1 of homicide, while the remaining 89 were attributed to accident or negligence. Three of these were referred to vehicles in the streets, 17 to burns and scalds, 9 to drowning, and 31 (of infants under one year of age) to suffocation in bed.

# Cases of Infectious Sickness in Hospitals.*

According to returns from the Metropolitan Asylum and London Fever Hospitals, and from the Highgate Small-pox Hospital, there were 3 cases of small-pox, 3707 of scarlet fever, 845 of diphtheria, and 116 of enteric fever under treatment in these hospitals on Saturday last (Table 3). The admissions during the week, as compared with those in the preceding three weeks, were as follow:—Of small-pox, 3 cases, against 0, 0, and 0; of scarlet fever, 271 cases, against 353, 291, and 219; of diphtheria, 115 cases, against 126, 125, and 129; and of enteric fever, 21 cases, against 9, 20, and 9.

## GREATER LONDON.

In Greater London 4078 births and 2316 deaths were registered, corresponding to annual rates of 34·4 and 19·6 per 1000 of the estimated population. In the Outer Ring, 9 deaths from measles, 7 from scarlet fever, 22 from diphtheria, 15 from whooping-cough, 2 from "fever," and 10 from diarrhea were registered. Four deaths from measles, 11 from diphtheria, 6 from whooping-cough, and 2 from "fever" occurred in West Ham district; 4 deaths from diphtheria occurred in Edmonton district, and 3 in Hendon district.

## METEOROLOGY.

The mean reading of the Barometer last week at Greenwich was 30.06 inches, and that of the Thermometer 42°1, the latter being 3°6 above the week's average in the 50 years 1841-90. The direction of the wind was variable, the horizontal movement of the air being 13 per cent. above the week's average in the 16 years 1860-75. The duration of registered bright sunshine in the week was 4.9 hours. The measured rainfall amounted to 0.32 of an inch.

^{*} The figures for the Hospitals represent patients certified on admission to be suffering from Small-pox, Scaulet Fever, Diphtheria, or Enteric Fever respectively; but in a considerable proportion of cases the diagnosis is found, after sojourn in the Hospital, to have been erroneous.

The numbers in this column are the average weekly deaths for the ten years 1886-95, raised by 5.541 per cent. for increase of oulation.

Those cases of small-pox only are returned as "vaccinated" or as "unvaccinated" which are so certified by registered medical attendant does not certify that the deceased has, or has not, been vaccinated, or when the gause of ath is not certified by a registered practitioner, the case is returned under the heading "no statement."

The evidence at inquests is often insufficient to enable the Coroner to certify whether a violent death be the result of cident, murder, manslaughter, or suicide. All such cases are classed under "accident."

Table 5. LONDON.*—Population; Births; Deaths from all Causes, and from Small-pox, Measi Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhæa, Violence, &c., registered in e Sub-district during the Week ending Saturday, 2nd January, 1897.

Wind as deduced from Anemometers.	Osler's.	reneral Direction.	* * * * * * * * * * * * * * * * * * *		WNW.WSW		SSW. S. &	SW.	WSW.	NNE. &		& N.	19	The results apply to the civil day, or from midnight to midnight.	correction has been applied to the readings to reduce to sea level. Observations are usually taken at 9th A.M.; moon; 3h. P.M.; and 9h. P.M. The means of the eye-readings of the barouneter, the dry bulb thermometer, and the wet bulb thermometer, are converted into mean daily values by the application of corrections deduced from a discussion	of the photographic recovers made during the ywenty years ending 1873 for the barometer, and during the twenty years ending 1888 for the thermometers. With the corrected mean reading of the dry bulb thermometer is combined the corrected mean of the readings of the maximum	and minimum thermometers, forming the mean daily value of temperature of the air (column 8). The mean daily dew point temperature and degree of humidity are deduced from the mean daily values of the dry and wer buile thermometer by Glaisher's Hygro.	Threal Tables. The average temperature of the air is that derived from a discussion of the observations ade at Greenwich during the 50 years ending 1880, and that of horizontal movement of the	the part from a discussion of the amenometric records for the 16 years ending 1875.  In reading the columns 9 and 24 it will be borne in mind that + 1s read "higher," and proceed." I than the average.  — "Loner," I than the average.	The values given in Country of are not corrected for the fluex error of the intermometer, which cannot be determined. The record of Electricity is derived from Thomson's self-registering Instrument. The symbols employed are:—P. positive; N. negative; w. weak; m. moderate; s. strong; and v. variable.	The numbers in column 28, derived from the Campbell-Stokes Sunshine Instrument, show e aggregate duration of bright sunshine on each day. The reading of the baroneter increased from 29 35 in. at the beginning of the week to 80 28 in.	by 5h. P.M. on Dec. 27h; decreased to 22°56 in. by 5h. P.M. on Dec. 25th; increased to 89°19 in. by 1lh. A.M. on Dec. 28th; decreased to 29°70 in. by 1lh. A.M. on Dec. 381s; increased to 89°40 in. by 10h. A.M. on Jan. 2; and decreased to 59°72 in. by the end of the week.
